"The fact that this stock has been considerably used for the propagation of small orange trees for house culture, and for grounds at the North, where the trees must be removed indoors in winter (for which it is especially well adapted), has led to the impression that varieties worked upon it were necessarily very much dwarfed. This is erroneous; in open-ground culture oranges upon Trifoliata stock are not dwarfs in this diminutive sense, but make good, sizable trees." A seven year tree is said to reach a height of eight to twelve feet in that time.

The Florida sour stock also shows magnificent growth, and for certain damp, heavy soils, has been used to advantage where the sweet root showed a far greater percentage of foot rot, and a tendency to gum disease. The pomelo stock is also a strong favorite, having a splendid root system producing a very thrifty even growing tree wich produces the best of fruit.

Of course the old California seedling stock is still the greatest in demand for any stocks yet used for budding. It has been tested for years and there seems to be no question of its adaptability to the usual conditions of California.

However, of all these varieties, Mr. Disbrow can supply any quantity a purchaser may need. His principal purchasers are nurserymen who deal in large quantities, or the large planter who is preparing for planting a couple of years later. By careful packing he finds an extensive market from San Diego to Sacramento, as well as in Arizona.

The perfect thrift and strong growth of the trees in all parts of this mammoth lath house compelled us to ask as to the method of getting such uniformly strong growth. So Mr. Disbrow kindly gave his method of procedure. First, he takes into the lath house a good strong horse and a plow, and the entire space is very deeply plowed. The subsequent detail work caused by tramping, some hardening of the soil, which was plowed a second time and thoroughly pulverized before it was ready for the seed. The surface is made perfectly smooth and nearly level and reduced to perfect tilt by continuous work. The beds are ten feet wide by 180 long. One by three strips are placed along either side of the bed, which is scraped down to a uniform surface one inch below top of strips by a straight edge with one side notched in each end, which is passed over the bed and gives it a final smoothing. This prepares the bed for the broadcasting of the seed.

Lath House From Above.

These seed had been previously secured from selected fruit of the pomelo, sour orange, sweet orange, Trifoliata and rough lemon, brought in from near and far, from Japan to the Bahamas. These are broadcasted over this prepared ground and then firmed into the soil by placing on top of the bed a plank. This protects the seed and keeps it in place when the fine sifted dirt is thrown over for the covering. This pulverized soil is placed over the seed exactly to the depth of a half inch. This depth is secured by using another straight edge with a half-inch notch instead of one inch in either end, which is passed carefully over the entire bed. A further covering of half an inch of clean white sand for a mulch is then added, a straight edge for the top straps on either side of the bed leaving a perfectly smooth, level surface. In the course of two or three weeks the first shoots and green leaves appear, when the work of weeding begins. Of course here, as in watering, tilling and all other processes of the work, the greatest care with these tender plants is necessary. The lath at the sides of the house and over the top temper the winds and the sun, so as to give the best condition for the tender plants. In the manner of watering, it may be in order to know, that all over the entire tract Mr. Disbrow has conveniently arranged hydrants so that the work is simplified so far as possible; which watering requires a full day's time for one man and is repeated every few days.

The planting of the seed was completed in June; the seedlings will be kept in the bed until at least the first of March, when they will have arrived at the proper size and the season will be favorable for planting in the open nursery row.

They are then placed in rows about four feet apart and one foot apart in row. In the following fall, if given reasonably good care, every one of the plants which are as thrifty as these of Mr. Disbrow's will be ready to receive the bud from a Navel, Valencia, the pomelo or any variety of lemon. This bud will lie dormant during the cold season and will be ready for the first sap of the spring, which should, during the following summer, give it a growth of three to six feet. They are, however, usually topped at three feet and forced to send out a symmetrical head. This gives a stockier, stronger growth and less dependent upon the stake than is the case with the whip-like taller tree. The following spring, which makes the time from the planting of the seed three years, they are ready for the orchard.

This gives something of an idea of the great extent of Mr. Disbrow's business in the seed-bed stock. Of course in addition it is noted, he does some planting in nursery row and budding of trees for the orchard. Outside of that we may merely mention the fact that he has in seed-bed and pots 10,000 to 15,000 Phoenix Canariensis; also a number of Washingtonia robusta. He also has a number of the best varieties of shade trees. In this collection are Sterculia diversifloia,

In the Seed-Bed House.

Acacia melanoxylon, Texas umbrella, rubber and camphor trees.

Any one interested in citrus stock will enjoy a trip to Pasadena to see this quantity of stock, and will find in Mr. Disbrow a man full of information and willingness to impart it to anyone interested.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

A GOOD ROSE LIST.

A recent vote on the twelve best roses to grow in Victoria, Australia, resulted as follows:

1	La France	338
2	Maman Cochet	324
3	The Bride	254
4	Kaiserin Augusta Victoria	219
5	Prince Camille de Rohan	209
6	Marechal Niel	201
7	White Maman Cochet	192
8	Cloth of Gold	182
9	Madame Lambard	177
10	Niphetos	143
11	Mrs. John Laing	123
12	Belle Siebrecht	121

This list is intended for bush growth though Marechal Niel is a climber, but one easily kept to a shrubby growth. This list is a most excellent one for California though not the best dozen; yet few would make so good a choice without an intimate knowledge of the different sorts.

Marie Van Houtte, our best rose, received 114 votes; White Papa Gontier, usually second here, got but 43. Other prominent roses in California were voted upon as follows. Catherine Mermet, 69, Caroline Testout, 58, Perle des Jardins, 55, Sunset, 49, Safrano, 44.

* * *

BUDDED, OR OWN ROOT ROSES?

Roses are usually worked in two ways: Budded on a strong stock like the Manette, Maiden's Blush, Dog Rose or sometimes the Banksin; or they are grown from cuttings and therefore on their own roots. Most home grown plants are of the latter class. while most commercial roses belong to the former. Every year the nursery and gardening trade journals engage (through correspondents) in a controversy respecting the merits of the two classes and a close tab kept on the writers, show that at least three-fourths of the best growers prefer the budded stock. The majority of kinds, when budded on a strong stock, will produce more blossoms, more solid and more perfect in form and of better keeping qualities when cut. The only objection to budded roses is that sometimes the stock will send up suckers, but the foliage is so much different that anyone should be able to tell them from the bud. Own root roses also are slower of development.

* * *

ORNAMENTAL SUNFLOWERS.

The true sunflower (Helianthus) number nearly a hundred species and of this number about one fourth are worthy of a place in the garden. Of our native Californian species we have two or three that are very showy. For massing as a background these plants are very effective, for by planting the dwarfer kinds in front (growing about four feet high) and the taller (ten feet) behind a very pretty showing can be made. In addition to singles, semi-doubles and doubles the flowers vary in a great many ways, some having broad petals, others pointed and narrow and still others having the petals twisted like a corkscrew. Some are pale yellow in color, while others are a decided orange; some have yellow center, others a dark one. Some species have very large flowers while others are but two inches across. The foliage varies much more than the blossoms and a collection will prove a very interesting study. All are easy to grow and most of them are perennial.

Observations in Orange Producing Countries.

It has been our pleasure to have a long interview with F. H. Disbrow, of Pasadena, regarding his trips through Mexico, Cuba, Porto Rico and Florida.

His first journey was made in 1901, when he took a trip through Mexico to Vera Cruz, thence sailed to Yucatan and Cuba. His object was to get an idea of the agricultural productions of those sections.

One point which Mr. Disbrow is very decided upon is that the possibilities of these countries as citrus fruit producers is over-estimated. While they all produce quantities of oranges the quality and the conditions under which they must be raised are such that a good California orange has nothing to fear. The condition under which the fruit is grown is certainly not the best. Both as to lack of modern methods of work, but more as to natural conditions. Some water for irrigation is lifted from a depth of 500 feet, and is often sold at a cent per five-gallon can.

In Mexico the temperature is much too low in most sections and the supply of water too limited. The greatest production is in the plateau land south of the City of Mexico. But here, again, is where the famous, or infamous, Morales orange worm has become established, which has practically ruined the industry in that vicinity. The buyers and shippers are mostly Americans and they usually refuse to buy any fruit from infected districts.

The tools used in soil tillage are of the crudest. Often a wood plow is seen, and the clumsy cart with solid wheels is seen creaking its way to market, though some oranges are taken to market on donkey back. The fruit ripens in November, all are seedlings, and of good flavor. The tariff is effectual in keeping the fruit out when American oranges are in the market.

From Vera Cruz ship was taken to Yucatan, where a cargo of sisal was shipped.

From Havana trips were made over much of the western end of Cuba. Some oranges are produced, most of orchards are young, but the conditions are certainly not favorable to the best results. Sugar is the principal product and is profitable.

Porto Rico has been considered a menace to California orange production, so it was with much interest that we learned from Mr. Disbrow his observations there. His trip there was a year later, or in 1902. He saw oranges, many of them. Sometimes hauled to town in ox cart, sometimes on burro back.

The roads are wretched except in the case of the military roads built from San Juan to Ponce, and from Ponce to Adjuntas. These were built at an expense of $12,000 per mile, some sections costing over $25,000. These facts more than offset the low freight rate which the five day steamer trip to New York gives.

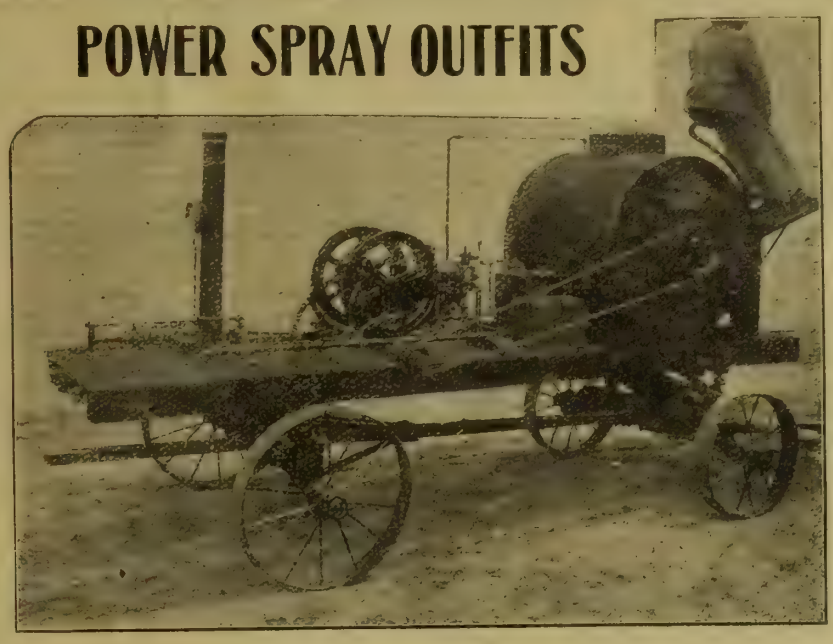
The entire northern side of the island has a very heavy rain fall, sometimes 100 inches. This, with the warm atmosphere, causes a heavy growth of fungus on all orange trees. South of the range of mountains which parallels the southern coast and not far from the coast, the conditions are much better. That is, the rainfall is light, but the irrigation which it necessitates is most expensive and under greatest difficulties.

Labor is cheap and at same time of poorest quality. There is not only lack of strength and disposition, but of intelligence.

North of the range where the rain is heavy, sugar production is profitable and will doubtless continue to occupy attention of planters.

All told, Mr. Disbrow says his trips convinced him that intelligent and careful orange culture in California has nothing to fear from any of the countries which he visited. There are but few conditions there which will ever attract intelligent laboring people. And fruit culture has as one of its essentials intelligent labor.

POWER SPRAY OUTFITS



Using Lambert Distillate and Crude Oil Engine for power—double-acting, outside-packed piston pump, especially designed for Power Spray Rig. Tanks are fitted with power agitator, which insures a perfect mixture. Built and for sale by

HOW HE WORKED.

The women at home with their petty cares,
They little know what a man does and dares;
He has to fight and he has to rush,
He has to hustle, he has to gush;
From morning to night he's on the go,
And rare are the pleasures he comes to know.
Thus said Sam Small as he went down town,
With a ghastly smile and a frenzied frown,
But later his wife on that self-same day,
Caught this hard-worked hub at the matinee.

CALIFORNIA'S WINTER.

A tang of the sea and a breath of the snow,
And a whisper from where the dark violets blow
With the sunshine commingle once more to remind us
That winter is searching for us, but can't find us—
In California.

The hills raise their arms, running over with holly,
And laugh to tell winter that searching is folly
Where orange trees groan with their fruitage of gold,
Or blossoms with stars when the year's growing old—
In California.

He is passing, he's searching with eyes that are bold.
And he breathes on our treasures with breath white and cold;
Then a curtain of mist falls from mountain to sea,
And they're hid from his gaze like a bride that's to be—
In California.

A handful of roses, a fair face above them,
A smile and a whisper, "I love them, I love them;"
A patter of raindrops which beat swift and bold,
And old winter has passed like a tale that is told—
In California.

—Claire Davis in Stockton Mail.

Would Reform the Carriage Caller.

"That caller is a fool," angrily reiterated Mr. Thompkins for the fortieth time.

"Why the poor man is doing the best he can," said Mrs. Thompkins, who was a sympathetic soul. "There are so many carriages, and the coachmen are so rude, and everybody is in such a jam."

"Anybody who had a thimbleful of gray matter under his hat could get these carriages up here all right," declared Mr. Thompkins. "That fellow is just a plain everyday idiot. I'd like nothing better than a chance to yank those coachmen around. I'll bet that if I were calling you would find those fellows getting in line and coming up right."

"Go ahead Thompkins," said a man who stood behind him, "Get out there and make good. Here's my check."

"And here's mine," said another, and in half a minute Mr. Thompkins had a dozen checks in his hand.

Mrs. Thompkins tried to restrain him, but Mr. Thompkins' fighting blood was up. He grabbed a megaphone that stood by the carriage step, and, walking grandly out into the road, looked at the first check he held and whooped:

"No. 435!"

No. 435 did not respond. Mr. Thompkins walked back and forth, baying the number into the night air. Then he walked down the street. At every step he whooped for No. 435. Finally a carriage started out of the shadows and a meek voiced coachman asked:

"Did you say 435?"

"Did I say 435?" bellowed Mr. Thompkins. "Did I say anything else?"

"I don't know, sir," replied the coachman. "I was askin' for information, sir."

"You get down to that carriage way as fast as you can," yelled Mr. Thompkins.

"But sir," said the coachman, "I—"

"You go; no back talk." Mr. Thompkins was positively impressive. The coachman drove his horses into the road and in front of two or three other carriages waiting there.

"Git back out of this," yelled one of the coachmen ahead. "What you gittin' ahead of us for?"

"Here you, man," shouted Mr. Thompkins. "You mind your own business. I'm master here. I'm calling these carriages."

"That's all right," said the coachman. "I don't know who you are but you can't send that guy in ahead of me."

"Can't I?" roared Mr. Thompkins. "O no! Can't I? You notice he's in there, don't you?"

"Yes, he's in there, but he don't stay long,'" replied the coachman, and he forthwith drove his plunging horses in ahead of the coachman that Mr. Thompkins had piloted from his retreat. Two or three other coachmen made sulphurous objections to these proceedings, and in less time than it takes to tell it there was a fine tangle of horses and carriages in the road.

"Here, you man, pull your carriage out of there; get that bay team to the side of the road. Give 435 a chance to get out there."

Mr. Thompkins was conscious that he was being watched by all the people who had heard his boasts, and he swelled up with importance and felt like Napoleon at Jena.

* * *

"Say, whiskers," yelled a coachman, "what are you trying to do, start something?"

"You rein your horses back there. I'm running this part of the show. You have no common caller to deal with."

"But that runt hain't going to git in front of me," shouted back the coachman. "His number hain't been called yet."

"I called No. 435 myself," said Mr. Thompkins, "and I want no more of your impudence."

"Ah, yer bughouse, whiskers. His number hain't 435."

"I say it is."

"You're a liar."

There was a snickering from the spectators on the sidewalk.

"Come down off that box," roared Mr. Thompkins. "Come down, I say, and I'll show you who is master here."

The coachman immediately turned the reins over to a footman and descended from the box.

"Don't you touch me," shrieked Mr. Thompkins. "Keep your hands off me or I'll have you arrested."

"You said that guy's number was 435. Now prove it," said the belligerent coachman.

"Isn't your number 435?" demanded Mr. Thompkins of the coachman he had sent in ahead of the other teams.

"No," said the man. "It's 439."

"You told me it was 435," shouted the exasperated Mr. Thompkins.

"Didn't either. I asked you what number you was calling, because you were getting down close to my number and I wanted to get ready to pull in."

"You're a stupid blockhead, you dundering fool."

The quiet coachman gave the reins to the footman with him and descended.

"Who's a dundering fool?" he demanded as he advanced upon Mr. Thompkins.

Mr. Thompkins attempted to reply, but somebody hit him. He started to run and another coachman hit him with his whip. Mr. Thompkins tumbled down and somebody jumped on him. Mrs. Thompkins came dashing out just in time to yank a whip away from a coachman. Five jehus were jumping on Mr. Thompkins all at once. Mrs. Thompkins laid about her with the whip with such good will that there was a precipitate retreat. Mrs. Thompkins gathered up her liege and whisked him through the carriages to the other side of the street and into their own carriage, which she descried in spite of the confusion.

"Home, James," said Mrs. Thompkins, quietly.

Mr. Thompkins said nothing. He still had the handful of checks of other people's carriages in his pocket. How they got home he didn't know. Nor did he particularly care. He had retired from his position of volunteer caller.—Chicago Tribune.

THE ATTIC CHAMBER.

And when I arrived at th' house, they gave me what they called th' attic chamber. But to say it quick, th' garret. It is that room where th' roof starts on th' floor at each side and meets in th' center overhead, and away from the center—on your head.

If I wanted to get up in th' middle of th' night I had to get up in th' middle of th' room. Once I missed th' middle of th' room and missed my breakfast the next morning.

I didn't come to until dinner time.

One day th' old man says: How's your room?"

I says: "Tip-top." I says: "I have done nothing but tip my top ever since I've been up there—and," I says, "Any time I don't tip my top, I get my top tipped."

In less than a week my head was covered with ceiling wax.

And the only window in that room was along under the eaves.

A little window about a foot wide and a yard long.

I used to have to get down on the floor to see out of it.

Half the time you couldn't tell whether I was looking out of th' window or saying my prayers.

But I discovered th' better way was—to back up to th' window as near as I could—then bend forward and look out between my ankles.

I used to stand there in th' morning and watch th' sun rise wrong side up.

Sometimes I couldn't tell whether it was going up or coming down.

One day th' old man had finished building a porch at th' back of th' house. He saw me looking out of th' window.

He says: "You ought to come down here and see my back stoop."

I says: "You ought to come up here and see mine."

The next day I had th' backache.

Th' old man says: "It's a rheumatic pain."

I says: "No; it's an attic-room pain."

When I was first shown that room the only thing in it was a string of dried apples and a bunch of tansy.

Mrs. Caldwell says: "You can have this room for a dollar—and we'll throw in th' bed.'

MACBETH,
on a lamp-chimney,
stays there.

My Index tells what chimney fits your lamp. If you use that chimney, you get perhaps twice as much light, and save a dollar or two a year of chimney-money,

I send it free; am glad to.

MACBETH, Pittsburgh.

Health Seekers

Those seeking health as well as wealth and pleasure should visit Pomona and Ontario, where advantages are found not existing elsewhere in Southern California. The climate is ideal and full of the ozone of health, while the land is teeming with the wealth of oranges and lemons, and can be bought very reasonable.

Pleasure can be found in miles of the finest drives and walks to mountain retreats and through beautiful valleys. Nature here is ever in a smiling mood and ablossom every month of the year. The pure air, rugged mountains and green leaved valleys lift the new comer to a realization of the joy of mere living Visit here and see for yourself.

SALT LAKE ROUTE

Takes you to this land of fruit and flowers in elegant vestibuled trains carrying Free Reclining Chair Cars, in the quickest possible time. The ride is interesting from start to finish and is through the fruit belt of Southern California. Excursion and commutation tickets are sold daily at all stations. Ask agents for particulars.

And they threw in th' bed when I wasn't looking.

And two of th' bed slats hit me in my slats.

Did you ever sleep on a slat bed? I'd just as soon sleep on a Zilliphone.

Narrow strips of board, you know, just near enough together to keep you from falling through—if you're thick enough.

If you get narrow, you're gone.

Then they have a sheet spread over th' slats, and if you believe that what you don't see won't hurt you, you are all right.

I got narrow th' first night. I fell through and hit th' floor ker plunk.

Th' next day th' landlady says: "Did you have the bed-spread over you?"

I says: "Not at first, I didn't—no."

I says: "At first I had the bed spread under me—and then I had th' bed spread over me."

And I had so much of th' bed spread over me that I couldn't get up.

Th' first night I said as usual—"Now I lay me down to sleep." But th' next night I knew better.

And you talk about heat—if you want to get th' most misery for your money in th' sunshine, go out into th' country.

The only cool thing on that farm was a picture in th' parlor of Washington crossing th' Delaware.

Hot afternoons, we used to go in and watch George juggle th' ice, just to see if it would make us feel cooler.

We never saw a piece of ice on th' farm.

And hot nights we used to have to sit up and fan th' milk.

To keep it from souring before morning.—From "Good Gravy," Ezra Kendall.

USES FOR KEROSENE.

A bright writer in the Farmers' Wife, summarizes the uses to which kerosene may be put as follows:

The kerosene can is not a thing of beauty, neither is it suggestive of strength, yet it is one of the most valuable of the housewife's allies. A spoonful of kerosene added to the basin of water in which the windows are to be washed, makes them beautifully clear and easy to polish, while at the same time it repels flies and mosquitoes. If screen doors and windows are thoroughly brushed and freed from dust, then wiped over with kerosene, they will look as good as new, while mosquitoes, flies and moth millers will give them a wide berth as long as any trace of the odor remains.

If, as is frequently the case in the best regulated families, the beds become infested with occupants that do not belong there, they may be exterminated by a free use of kerosene. If one has a careless neighbor, as is apt to be the case in an apartment house, baseboards, window sills and the springs of beds should be wiped off with oil at least once a week as a preventative.

Applied liberally about the kitchen sink, boiler and piper, cockroaches and water bugs may be defied, even in an old house.

For wagon grease or tar spots rub well with kerosene while the grease is fresh, then wash out in cold, soft water, using no soap.

Kerosene will remove ink stains and fresh paint, while nothing takes out blood stains better than cold soap suds to which kerosene has been added.

Irons that have been put away sticky should be well scraped with a thin knife, then rubbed with a rough cloth, moistened with kerosene.

A spoonful of kerosene in boiled starch keeps it from sticking, but do not use enough to make it smell of the oil.

Nothing equals kerosene for cleaning porcelain bath tubs. The ugly black streak around the sides that requires such vigorous rubbing when only soap and water is used, disappears as if by magic when wiped with a soft cloth, moistened with kerosene.

Common kerosene is excellent in cleaning hardwood or stained floors. Sweep carefully and dust before applying the oil. Use only a small quantity at a time, wiping a small space, then rubbing the oil up with a soft, absorbent flannel cloth.

Recipes...

CREAM GINGERBREAD.

Beat two eggs until light; add to them one cupful molasses, half a teaspoonful vanilla, one teaspoonful ginger, half a teaspoonful of cinnamon and a saltspoonful of salt. Now to one cupful of thick, sour cream add a level teaspoonful of soda; then with a wire whip beat the cream till it is light and frothy. Add to the other ingredients, with flour to make a soft batter. Beat well, and bake in moderate oven.

CHICKEN CROQUETTES.

To one pint of cold boiled chicken, finely minced, add one cupful of sifted bread crumbs, a tablespoonful melted butter, two beaten eggs, cayenne pepper, and salt to taste, one tablespoonful chopped parsley, a teaspoonful of mushroon or tomato catsup, a few grains mace, and, if more moisture is needed, add it in the form of sweet cream. Flour the hands and make the croquette in any shape desired, and fry in basket in hot fat.

SARDINE SANDWICHES.

Open a can of sardines, remove all bones and pieces of skin; chop fine, adding a teaspoonful of peppersauce, one of lemon juice, and a few drops of oil if liked. Spread slices of white bread, buttered, with this, press another slice over, and cut in fancy shapes.

EGG PUFFS OR POPOVERS.

First of all, see that the oven is hot. Less time will, of course, be needed for heating a gas oven than when a coal range is used, but see to it that heat is sufficient to spring or burst the wheat cells the moment the puffs are put in. After this let the heat down a little. Have the gem pans hot also. Beat one egg, light, in a bowl large enough to hold the batter; pour in a cupful of unskimmed milk, then add one cupful of sifted flour with a little less than a quarter of a teaspoonful of salt. Beat thoroughly and drop at once into the hot butter pans. These should be about half filled. From thirty to forty minutes will be required for baking. Each puff should be, when done, a shell of richly browned crust, and should have tipped over a little to one side. If properly made they will not fall even when cool. They may be rewarmed, and are almost as good as when freshly made. One or more trials may be necessary in order to learn to make them perfect. A teaspoonful of flour may have to be added to or taken from the cupful, according to the size of the egg, but the batter must be thinner than ordinary mixtures.

USEFUL INSECTS.

The old colored parson gazed at the swarming mosquitos with a sigh.

"Yes," he mused, "dem dah mosquitoes am smahteh than I is. Dey can keep the congregation awake, 'en I can't."—Chicago News.

WORK AND PLAY.

I'm not sure about my headline, I almost think it should be "Play and Work"—so few of us ever get past the "work" part—and really it is hard to find time for anything outside of work. If only inventive genius had given women machines to lighten labor, as lavishly as they have sprung up to do away with outdoor drudgery, then perhaps the play time would be more in evidence. However, I'm not sure we are making the most of what we have. When the sewing machine came to simplify the problem of getting the spring and fall sewing out of the way, we decided to have a dozen fine tucks, where formerly one deep one (for lenghtening purposes only) was used, and how we do shirr and ruffle and pucker and stitch things! Sure enough—what was the machine invented for? to save work, or to make more work? The truth is, woman uses her machinery far differently from what a man does. He takes his sulky plow, binder and mower into a field and uses it to accomplish necessary work in the most expeditious manner. Each implement is fitted to do certain work and a man is usually content to let well enough alone; he doesn't say "I believe instead of cutting this grass close to the ground for hay. I'll go over the ground five or six times and cut it into short lengths, it won't take any longer than it did to cut the field with a scythe and my hay will be different from neighbor Smith's."

But let a woman get a new stove, that is a quicker and better baker and she hies to the bookstore for a new cook book, that she may learn of a dozen things to bake, broil or stew, where formerly a few was sufficient; and so we go on multiplying cares and duties instead of studying to simplyfy them. Then soon we discover that we have nerves, and soon everybody else discovers it, to their sorrow. Let's turn over a new leaf and resolve to live a little plainer; have fewer drapes, throws, tidies, bric-a-brac and ornaments (?) to care for, and strive to get more real happiness out of life.

So many of us spend our substance for that which is naught. Today the piano is as common in our houses as was the spinning wheel in our grandmother's day, not that the people of today are more in love with music, but it is fashionable to have a piano and my neighbor says "it's a nice piece of furniture." Very well, so is a bath tub and accessories—but not one house in a hundred has a well equipped bath room. There is need of a revolution in home making, and housekeeping. Utility should come first; cleanliness and comfort must never be sacrificed for show if we would find time for play, without which Sarah Jane becomes a nervous, cross and stupid woman.—Up-to-Date Farming.

A GIRL'S EDUCATION.

Somebody complains that, "Our girls are being educated while our boys are being kept at home to work," thus unfitting them for housekeepers, and by their superior accomplishments, unfitting them for congenial companions for our boys. There is no probability of either sex getting more education than they will need, nor is it probable that a good education will unfit any girl for the duties of housekeeping and home-making. We are in favor of having both sexes taught all they ought to know, and all they are capable of learning. Let the girls be taught to sing, to perform on some instrument, to draw and paint, and along with these accomplishments they should learn how to make beds smoothly and neatly, to sweep, arrange furniture, bake bread and cakes, roast meat, to fashion and fit neatly their own dresses, make their own underclothing and that of their brothers, how to repair and remodel or renovate an entire wardrobe. To learn all these things one must learn gradually, and a girl who doesn't know how to do all these things cannot claim to possess a superior education, even though she sings divinely, plays beautifully, can conjugate the verb amo in half a dozen languages, or dresses so exquisitely as to turn the heads of half her male acquaintances. To be respected and self-respecting she should thoroughly understand the fine arts of home life. It is the girl who is proficient in these arts who is valued as daughter, sister or wife.—Mrs. Buchannan in Farm and Ranch.

"BOSSY" HUSBANDS.

The husband still ranks as the head of the family, and though cases are common where he is not really in command, the happiest families are those in which he is equal to the job. It is not any word of scripture or law or a promise in the marriage service that makes the husband the senior and ruling partner, but nature and the force of circumstances. Moreover, the fear which some young women have of having to obey a husband is just a bugaboo. As things turn out there is division of responsibility, and therefore of authority. The wife has her realm and rules it. The husband takes her orders in matters under her control and she his in some other matters, and over other matters still they consult and agree upon a course. Of course a bossy husband is objectionable, but a bossy husband is apt to be a good deal of an ass, and no young woman ought to marry a man who is a good deal of an ass unless the exigency is pressing and she can positively do no better.—Harper's Weekly.

FRINGE THE FASHION.

Though fringe can date its popularity back some thousands of years, yet it is nevertheless one of the most fashionable trimmings today. Perhaps the modern smart girl has inherited her fondness for fringe. Whether she has or whether she hasn't, she always appears glad to welcome it back into fashionable favor after it has been out of date for a time.

This autumn fringes of all sorts are the vogue—fine silk fringe, coarse cord fringe, jet fringe and cloth fringe. Fringe is used to give the touch that tells to the smart girl's ribbon neckties, as well as to her best cloth street gown.—October Woman's Home Companion.

MADE EVERYTHING FRESH.

"How fresh the rain makes everything," she said, gazing around after the shower.

"Oh, yes," he said eagerly. "See how the flowers look up and rejoice; see how the grass exults; all nature seems to smile and my love for you after the silence with which you have treated me these last few days is merely like these flowers after the shower, fresher and sweeter than ever."

"Yes," she resumed," the shower has made everything fresh, even you."—Exchange.

To live content with small means; to seek elegance rather than luxury, and refinemet rather than fashion; to be worthy, not respectable; to study hard, think quietly, talk gently, act frankly; to listen to stars and birds, to babies and sages, with open heart; to bear all cheerfully, to do all bravely, await occasions, hurry never—In a word, to let the spiritual, unbidden and unconscious, grow up through the common. This is to be my symphony. —William Ellery Channing.

TROUBLE ABOVE.

"The critics have praised my new book to the skies," said the author.

"What in the world did they have against the angels?"—Atlanta Constitution.

THE BEAUTIFUL STAR.

Wherever you are,
There's a beautiful star
That watches you night and day.

Whenever you're bad,
That star is sad;
But when you are good,

Whoever you are,
That wonderful star
Just sings as an angel should!

A MOTHER COD JINGLE.

Little Johnny Bump
Sat on a stump
A-picking the thistles out of his feet;
Along came a bear
Which made John stare,
And fall off the stump in a heap.

"The Quality Store."

The Clothes Question

To dress well or not to dress well is no longer a question. The question now is, "Where can I get the best clothes for my money?" This store has settled that question for many years, and is better prepared than ever to settle it this fall.
All the newest novelties and the good old "stand-bys" made into the finest garments that human skill and genius can devise,

FIRST AND SPRING LOS ANGELES, CAL.

GO TO GARDENA.....

Where the alfalfa grows so luxuriantly, giving from 6 to 8 cuttings per year, and producing when fed to cows a superior product of milk and butter—the secret — there being no alkali to detract from the purity of the milk, as demonstrated by the noted Strawberry Brand of Butter made by Mr. Davis of Gardena. The success of our Chicken Ranches depends upon having green alfalfa as a food product in the production of eggs at a time of the year when the dry ranch farmer has no green feed to make the hens lay. Our small alfalfa, dairy and chicken ranches are making good livings.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

Los Angeles Markets.

Los Angeles, November 12.

Lower quotations marked the butter deals Thursday. Lower prices will obtain until the supply in storage is reduced.

Dealers on the street have come to the conclusion not to sell Bellefleur at the quotations of the past few days. The supply of Bellefleurs will very soon have to come from cold storage.

Walnuts have shown a firm market. The walnut crop of Southern California, it is estimated, will be about one-third or one-half short this season and instead of the usual 650 cars the railway companies are planning to handle the total crop for the season with 450.

Potatoes show stronger feeling in the local market and the selling price on Highland stock has been marked up from 10 to 15 cents per hundred.

The scarcity of onions on this market is very noticeable; firms caught short had difficutly in filling orders with prime stock. This fact made the prevailing price about $1.25 per hundred yesterday.

Butter moved freely; market in steady condition again.

Ranch eggs are stiff at 38 cents and more per dozen, on account of scarceity; other grades firm.

Celery in good supply.

Beans continue weak.

Poultry wanted.

San Francisco Markets.

Dairy.

San Francisco, Nov. 12.

A firm tone characterized the market for fancy butter all the past week. Thursday experienced a shortage in the market early in the day, but prices ruled steady and closed last night (Thursday) at the same quotations as were met early in the day.

Recipts on Thursday were 44,100 pounds.

BUTTER—Per lb:

Creamery, extras	.32 @33
Creamry, good to fancy	.26 @30
Dairy extras	.24 @25
Dairy choice	.22 @23
Store	.18 @20
California storage	.24 @27
Eastern Creamery	.23 @25

There was no change in the quotations for cheese during the entire week, the demand being about normal.

Eggs and Poultry.

Really fancy eggs have been scarce this week and the demand has been steady, even firm, with values showing slight improvement over last week. Receipts Thursday, 657 cases.

EGGS—Per doz:

Ranch, selected large	.44 @45
Ranch, good to choice	.40 @43
Store	Nominal
California storage	.28 @33
Eastern	.26 @31

Poultry has presented a sharp front all the week past. Notwithstanding the supply was liberal the demand kept lively pace and it was only now and then that the supply equaled the demand. On the whole poultry was short.

POULTRY—Old Roosters, per doz, $4.50@5; young Roosters, $5.50@6; Fryers, $4.50@5.50; Broilers, large, $3.50@4.50; small, $3@3.50; Hens, small, $5@6; large, $6@6.50; Ducks, per doz, old, $4@5; young, $5@6; Turkeys, young, per lb., 17@19c; old, 14@16c; Geese, per pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz, old, $1@1.25; Squabs, $1.75@2.25.

Fruits and Vegetables.

Apples have been in good demand during the week, especially the better class. Strawberries and Raspberries coming in freely, with values easier than on the previous week.

APPLES—Per box, common to choice, 25@90; fancy, $1@1.30.

PEARS—Per box: Winter Nellis, 75c@1.25; other varieties, per box, 35@75c.

PLUMS—Late Red, per box, 50@65c.

FIGS—Per box, 75@$1.

NUTMEG MELONS—Per box, 40@75c.

POMEGRANATES—Per small box, 50@75c; large box, $1.50@2.50.

PERSIMMONS—Per box, 50c@$1.

QUINCES—Per box, 40@65c.

TABLE GRAPES—Per small box, 25@50c; crate, 40@65c; large box, 85c@1.50; as to variety; Wine Grapes, per ton, $12@20.

BERRIES—Per chest: Strawberries, Longworth, $6@12; Malindas, $2@4; other large varieties, $4@6; as to quality; Raspberries, $5@7; Huckleberries, per lb, ——; Cranberries, per bbl., Eastern, $10.50@11.50; Oregon, per box, $2.50@3.

CITRUS FRUITS—Per box: Oranges, Navels, new crop, $3@3.50;; Valencias, $2.50@3.75.

No particular change marked the vegetable exchange during the week, although a keen buying interest was noted in the better kinds of Potatoes suitable for table use, and the market for these descriptions ruled firm at top quotations, with moderate supplies available.

VEGETABLES—Tomatoes, per box, 25@60c; Green Peppers, per box, Bell, 50@75c; Chile, 30@50c; String Beans, per lb, 2@3c; Wax, 2c @3c; Lima, per lb, 3½@5c; Green Peas, per lb, 2½@3½c; Egg Plant, per box, 50@75c; Summer Squash, per box, 60@75c; Cucumbers, per box, 50@75c; Garlic, per lb, 4@5c; Okra, per box, 50@65c; Marrowfat Squash, per ton, $10@ $12.50; Hubbard, $12.50@15.

ONIONS—Yellow, per ctl, 60@92½c.

Dried Fruits, Nuts, Etc.

The market for dried fruits has been dull. Ther is practically no change in last week's quotations.

DRIED FRUITS.—Prices for carload lots, f.

Apples—Evaporated, 5@6c; Sun Dried, 3½ @4c.

Apricots—Royal, fancy, 9½@10c; choice, 8@ 8½c; Moorparks, choice, 10@12c.

Peaches—Choice, 5¼@6½c; fancy, 8½@9c. peeled, in boxes, nominal.

Pears—Choice, 6½@7c; fancy, 8½@9c.

Plums—Pitted, 5@7c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 3@3¼c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Black, 4@4½c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1903 crop, f. o. b. at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.35; Two-Crown London Layers, $1.25; Muscatels, Four-Crown Standard, loose, 6½c per lb; do, Three-Crown, 5⅝c; do, Two-Crown, 5¼c; Seedless Muscatels, 4¼c; Seedless Muscatels, floated, 4½c; Seedless Standard Sultanas, 4¼c; Thompson Seedless, Standard Sultanas, lencias, Standards, 4¼c; do, Pacifics, 3¾c; Orientals, 2¾c; Malagas, Three-Crown, 5⅝c; do, Two-Crown, 5c.

Seeded Raisins—Prices for limited quantities are as follows: Fancy, 16 oz, per lb, 8c; choice, 7⅝c; fancy, 12 oz, per pkg, 6⅝c.

NUTS—Per lb: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Peanuts, Eastern, 6@6½c; California, Walnuts, soft shells, No. 1, 13@14c; do, No. 2, 11@12c; hard shell, No. 1, 12@13c; do, No. 2, 10@11c.

Beans.

The little business recorded in the Bean market was done in a small way this week and prices continue nominal in character. Slight revisions, however, are noted in prices, Pinks and Bayos being quoted slightly higher, while Small Whites and Pea Beans were marked down a shade. Limas are a little steadier.

BEANS—Prices per ctl: Large Whites, $2.15@2.50; small do, $2.90@3.10; Pea, $3@3.10; Lima, $2.90; Red, $2.90@3; Pink, $2.20@2.45; Bayo, $2.20@2.45; Blackeyes, $2.15@2.35; Red Kidneys, $4.25.

DRIED PEAS—Green, $2@2.50; Niles, $2.35 @2.50.

Prices on Honey were not changed during the week. The supply was fully equal to the demand.

NEW YORK, November 12.—The market for Evaporated Apples continues quiet with demand moderate, but as supplies are light, there is little pressure to sell. Common are quoted at 4¾@5½c; Prime, 5¾@6c; Choice, 6¼@6⅝c, and Fancy at 7c. Prunes remain quiet. Stocks are fairly liberal and demand jobbing chacater, quotations ranging from 2½@7c for all grades. Apricots are without special feature at the moment. Choice are quoted at 9@9½c; Extra Choice, 10@10½c, and Fancy at 11@12½c. Peaches ruled generally quiet. Choice are hard at 7¼@7¾c; Extra Choice at 7¾@8¼c, and Fancy 9¼@10¼c.

Live Stock.

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 6¼@7c; No. 1 Cows and Heifers, 6½c, second quality, 5½@6c; thin Cows and Heifers, 4@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½c @4c, gross weight; Ewes, No. 1, 3¼@3¾c; gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb, live weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs and over, 5⅜@5½c; weighing under 130 lbs, 5@5¼c; weighing 260 to 350 lbs, 5@5¼c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

HAY—Prices on Hay, per ton: Wheat, $13.50@17; Wheat and Oat, $13@16; Oat, $11.50 @$14.50; Barley, $10@13; Clover, $9.50@11.50; Alfalfa, $$9.50@12; Stock, $8.50@10.50.

STRAW—Good to choice, per bale, 55@65c.

FEED CORN MEAL—Choice grades, per ton, $30@31.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26.50@29.

BRAN—Per ton, $22@23.

CRACKED CORN—Choice quality, per ton, $30.50@31.50.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

BRAN—Per ton, $21@22.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@ 4.85 per bbl; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

BARLEY—Choice, No. 1 Feed, $1.13¾@ 1.16¼; off grades, $1.10@1.12½; Brewing, No. 1, $1.18¾@1.23¾; Chevalier, $1.30@1.45.

RYE—Good to choice, per ctl., $1.25@1.30.

CORN—Good to choice, per ctl: California, new, large Yellow, $1.35@1.40; small, do, nominal; White, $1.35@1.40.

OATS—Good to choice White, $1.25@1.35; Red, $1.22@1.35; Black, nominal at $1.40@ $1.65.

Hops.

The price for new crop is 20@22½c, according to quality.

Wool.

Fall clip, per lb: California, Plains, 7@8c; Foothills, 8@10c; Middle Country, 10@12c; San Joaquin Lambs, 8@10c; Northern Free, 11@12c; do, defective, 10@11c; Humboldt and Mendocino, 11@13c; Nevada, 10@13c; Oregon, Valley Spring, 17@18c; Eastern do, 10@14c.

HONEY.

Honey manifests a disposition to slightly shade prices and is now being stored in greater quantity than heretofore. The quotation, while but little if any shaded, some producers are slightly shading on the prices.

HONEY—New comb, per lb:: White, 12@ 14c; Amber, 10@12c; Extracted Water White, 5½@6c; Light Amber, 5@5½c; Dark Amber, 4½@5c.

BEESWAX—Per lb., 30c.

Eastern Markets.

Grain and Produce.

CHICAGO, Nov. 11.—Firm cables brought out a fairly good demand for both December and May wheat at the start, and December opened ⅛ to ⅜ higher, at 77¼@77½. Offerings were light early in the day and with a fair advance in the price of December at Minneapolis, December advanced to 77⅞ within the first hour. Later in the day weakness in corn, with lower prices at Minneapolis and New York, brought heavy selling orders, and the market became very weak. Large primary receipts and small clearances helped to create a bearish sentiment. Closing prices were at about the bottom, with December ¾ lower, at 76⅜ after it had tuoched 76¼. Corn ruled extremely weak after a firm opening. December closed at 42⅛@42¼, a loss of ⅝ to ¾. Oats encountered a fairly steady market until the corn break, and then prices declined. December closed ⅛ to ⅝ lower at 33⅞ @34. Provisions were steady early in the day on a good cash business and on a strong demand for lard, but later, with grain prices showing weakness, the market turned weak. Pork closed 12½c lower; January lard 7½@10c lower, and ribs 7½@10c lower.

Cash quotations were as follows: Flour was active, but weak; No. 3 spring wheat, 75@76; No. 2 red, 76¾@79⅞; No. 2 corn, 42¼; No. 2 yellow, 43¼; No. 2 oats, 34¾; No. 3 white, 33½ @37; No. 2 rye, 53½; good feeding barley, 33@ 38; fair to choice malting, 48@56.

Chicago Live Stock.

CHICAGO LIVE STOCK MARKET.

CHICAGO, Nov. 11.—Cattle—Receipts, 22,000, including 2500 western; steady; good to prime steers, 5.25@5.65;; poor to medium, 3.25 @4.75;stockers and feeders, 1.75@3.25; cows, 1.25@4.25; heifers, 2.00@4.50; canners, 1.25@ 2.25; bulls, 1.75@4.25; calves, 2.50@7.50; Texas-fed steers, 2.75@3.50; western steers, 3.00@4.25. Hogs—Receipts today, 25,000; tomorrow, 25,000; market steady to 5c higher; mixed and butchers', 4.50@5.05; good to choice heavy, 4.40@4.90; rough heavy, 4.10@4.50; light, 4.50 @4.90; bulk of sales, 4.50@4.75. Sheep—Receipts, 26,000; sheep and lambs steady; good to choice wethers, 3.75@4.25; fair to choice mixed, 2.75@3.25; western sheep, 3.50@4.15; native lambs, 4.00@5.75; western lambs, 4.25 @5.10.

DAIRY MARKET.

On the Produce Exchange today the butter market was steady; creamery, 15@20½; dairy, 14@18½; eggs, firm, 21½@23½; cheese, 10@11.

California Dried Fruits.

NEW YORK, Nov. 11.—Evaporated apples are in light supply, the market closing steady, with common quoted at 4@5½; prime, 5¾@6; choice, 6¼@6¾; fancy, 7. Prunes quiet; prices range from 2½@7 for all grades. Apricots are quiet, choice, 9¼@10; extra choice, 10@10½. Peaches are dull; choice, 7¼@7¾; extra choice, 7¾@8¼; fancy, 9¼@10¼.

NEW YORK, Nov. 11.—Wheat, spot weak; options closed ⅝ to ⅛ lower; May closed 81; Decmber, 83⅞. Hides steady. Wool firm. Coffee, spot Rio steady; No. 7 invoice, 6⅛; mild, firm. Sugar, raw, nominal; refined quiet.

LIVERPOOL GRAIN.

LIVERPOOL, Nov. 11.—Close—Wheat, December, 6s 5d; March, 6s 4¼d; May, 6s 3¾d.

CITRUS MARKETS

ORANGE SHIPMENTS.

Following is a daily statement to cover a period of one week, showing number of carloads of citrus fruits shipped East from Southern California during the season beginning November 1, 1903:

Of the season's total 35 carloads were lemons.

NEW YORK, Nov. 12.

Continual demand has made a satisfactory market for good fruit the past week. Florida and Jamaca oranges continue to come in. Prices on poorer qualities of oranges have been lower, and the prospect is for a continuation of moderate prices on inferior fruit.

Fancy lemons brought a high price during the early days of the week. But secondary fruit shows a natural decline.

AUCTIONS.

NEW YORK, Nov. 4.

We recently saw one of the finest drinking fountains for poultry yards which it has been our privilege to see. It is the Eureka fountain and is manufactured by the Eureka Supply Co. of 257 Poe street, Los Angeles. Is is made of galvanized iron, with air chamber above the water to protect from heat or sun. The water is fed to small receptacle at bottom as fast as consumed. Its strong points are, pure water constantly supplied, convenience in filling, arrangement for hanging up to keep out of dirt and with it all, cheapness.

FINE NURSERY STOCK We are now opening our sales yard at No. 632 S. Spring St., Los Angeles. We will soon have on hand a full line of northern as well as home-grown Deciduous Trees in quantity. Also some of finest Citrus Trees grown in the South. Having had between 26 and 80 years' experience in fruit and tree planting, we are enabled to offer suggestions as to best and most profitable varieties for Southern California. Ornamentals and Trees for street and lawn planting. Yours truly,

STEWART BROTHERS

632 S. Spring Street Los Angeles, Cal.

NO EXCEPTION

Last year we said the Tilton Apricot was a regular bearer. NEVER FAILS. This year is no exception. Every tree bore heavily; old ones as well as the newer planted orchards.

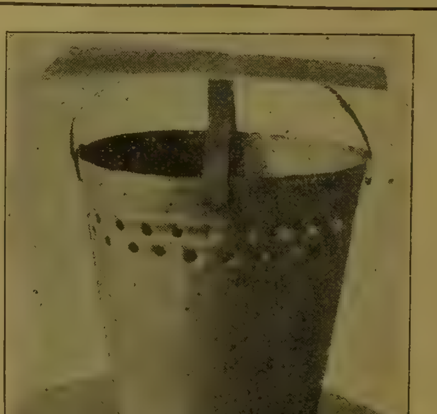
Fifteen Years' Test

and still the

TILTON APRICOT

Is a winner. Large, highly flavored, good color. In the dried fruits the Tilton won First Premium at the Great Central California Fair. Liked by canners. Original tree 18 years old near our nursery. Buy trees where you can get true to name buds from original stock from the Original Tilton Nurseryman. A thrifty lot of peaches and other deciduous trees.

J. W. BAIRSTOW HANFORD, CAL.



SAFE AND SURE METHOD OF PREVENTING FROST

USE DISTILLATE

NO SMUT SIMPLE AND EFFECTIVE

Note the following extracts written by prominent fruit growers:

"If growers would generally place pots in their ranches, 25 pots fired per acre, in any frost we have had, would thoroughly protect the trees and fruit. I am sure many more will put in the oil pots next winter."—D. B. Bailey, Rialto, San Bernardino County.

"I am perfectly satisfied with the results. It furnishes sufficient heat to prevent frost damage during periods of cold weather and does not smut the fruit or trees. I find it even possible with these devices to carry the winter blossoms in my lemon grove through for summer crop."—N. W. Moodey, Glen Ellen Orange and Lemon Grove, Centerville, Fresno County.

"During the recent frosts the oil pots saved our crop except a few on the outside of the ten acres of Valencias."—W. R. Wood, Exeter, Tulare County.

"I found that, although the temperature fell to 20 degrees outside the protected area on January 16th, and again on February 14th, 40 pots to the acre gave me all the heat I needed for protection. I estimate that the crop saved on the Camilla orchard this season is worth $20,000. The fruit is heal hy, wtih fine fiavor, weight and color."—N. G. Simms, Camilla Orange Grove, Lindsay, Tulare County.

Producing Eggs at $5 Per Dozen

At this season of the year many of tne poultrymen are producing eggs at a cost of from $3 to $5 per dozen, and they are selling them at 50c per dozen or more and losing money every day, when now is the time they should be just coining money.

The average poultryman thinks to be saving on tne feed by buying cheap feed, the cheapest he can get, chop feed, shorts, etc., or anything that is the cheapest and he hauls it home and feeds three or four sacks of feed to get one dozen eggs and thus he produces eggs at from $1 to $5 per dozen.

It would be better for the poultrymen to pay $30 a ton, $40 or $50, or even $100 a ton for feed and get feed that produces eggs. Even at $100 a ton, a feed that three pounds of it fed to hens that will make them lay one dozen eggs, is cheaper than feed that you have to feed three or four sacks to get one dozen eggs.

Producing Eggs at 17c a Dozen on Coulson's Egg Food

L. K. Pierce on Mt. View avenue, Petaluma, has 450 hens which he feeds Coulson's Egg Food. It costs him $2.00 per day to feed the 450 hens and a few days ago when eggs were bringing 50c a dozen he received $6.00 per day from eggs sold, making a profit of $4.00 a day on 450 hens.

D. H. Ward, of Cotati, feeds Coulson's Egg Food and gets an average of 90 dozen eggs a week from his 500 laying hens. When eggs were 50c a dozen, Mr. Ward received $45 a week from eggs sold, and the cost of feed by feeding them all they will eat of Coulson's Egg Food as a mash, and wheat in the scratching pens is not over $16 per week. So Mr. Ward clears over $25 a week on 500 hens by feeding Coulson's Egg Food.

The Secret of Success in Poultry Keeping

The day has passed for making money with poultry by old fashioned methods. The farmers and poultry keepers that are making any money today are the wide-awake, progressive men and women, who study their business, who take advantage of the best facilities, latest improvements, modern methods, etc. In short they keep up with the times. They are the leaders and others who don't keep up to date are unable to comprehend the mystery of their success.

Incubators have taken the place of setting hens, and the study of the poultry keeper now is to make hens profitable in egg production, and to know what is needed and what is best when so many things have been called good for egg production.

We believe the majority of poultrykeepers obtain about one-half the quantity of eggs their hens are capable of laying per year, and they must keep a hen four years to get as many eggs as might be produced in two years.

A hen can be made to produce as many eggs in the first two years as she would naturally in four years.

Business in poultry is poultry for profit, and it is the most profitable branch of any farmer's business if properly cared for.

The hen must be kept in laying condition by feeding the proper food. Coulson's Balanced Egg Ration should be fed to every laying hen one meal a day the year round.

Coulson's Egg Food is no longer an experiment. It has been tested, tried and proved to be a success.

We know whereof we speak. Coulson's Egg Food will double the egg production of your hens.

The profit of poultry keeping depends upon the production of eggs, and while there are many other things to be considered in care of poultry besides proper feeding, yet we find that the most important thing of all, special feeding for eggs, has been overlooked by many of the poultry keepers. The analysis of eggs shows them to contain a variety of ingredients in definite proportions. To produce eggs in quantity, with economy, it is necessary to feed these component parts in proper proportions and in form more easily assimilated and digested.

Many have failed to make poultry profitable because they did not fully realize this.

Coulson's Balanced Ration Egg Food has been tested, and proved to be successful, and is now fed exclusively by many of the largest poultry raisers in the Southern, as well as Northern and Central parts of California.

It is just as proper and necessary to feed hens especially for eggs as it is to feed cows especially for milk, and sooner or later poultry keepers will wake up to this fact.

Loading Cars with Coulson's Egg Food

Chas. Miles on His Annual Trip Through Southern California—Photo taken at Watsonville

Profits from Poultry
Depends Upon How and What You Feed

Coulson's Egg Food, a balanced ration of ready mixed feed for laying hens is what makes the hens lay lots of eggs, and now that eggs are bringing a good price you should purchase a ton or two of this feed and make some money out of your hens.

Hints on Tree Planting

BY JOHN ISAAC, SACRAMENTO

The tree planting season is close upon us again, and from reports of nurserymen who are already crowded with orders, there will be no diminuation in the new acreage set out this year as compared with former seasons. It is really astonishing when we consider the vast numbers of trees that are set out each year, not that we have so large a fruit acreage in our State, but that it is not larger. It is safe to say that four-fifths of the trees sold by nurserymen never reach bearing age, while a large part of the remainder merely replace abandoned orchards, and so while the fruit acreage is steadily increasing, it does not do so as rapidly as the production and sale of nursery stock would seem to indicate.

Among the many who will plant fruit trees the coming season will be many beginners and a few hints for their guidance may not be out of place at the present time.

Deciduous trees should be planted in our State as nearly as possible after the winter rains have commenced. In our climate deciduous trees have no season of complete dormancy, and the roots maintain some degree of activity even while the tops are in a state of rest. This is demonstrated by the fact that trees planted early in the season, the roots of which have been pruned, will form a callous over the wound, and will very often start new roots, before the buds on the top begin to swell. Early planting is therefore to be recommended as it settles the dirt thoroughly about the roots and gives them a chance to start before the top draws upon them for its sustenance. The young tree should always find the soil prepared for its reception by deep plowing and thorough pulverization. Remember that when the orchard is planted this can never be done so well, and the time and money spent in preparing the soil for the trees will be many times returned during the life of the orchard.

The holes should also be ready and these should be of ample size to receive the roots of the young trees without crowding. It is the rule of many of our best orchardists to dig deep holes, throwing the bottom dirt on one side and filing up the holes with the surface soil.

Young trees should not be exposed to the air longer than possible and are in the best condition when taken directly from the nursery to the place of planting and, even in the transit, they should be protected by having their roots covered.

In planting it is best to set them a little higher than they grew in the nursery. The loose soil around them will settle and fill in when they will be at the same depth. Never plant them deeper than they originally grew. We have known orchards utterly ruined by careless or ignorant planters setting the trees several inches below their original position.

All injured roots should be removed, and whether more root pruning should be done is yet an open question among many planters. The Stringfellow method, as it is called, advocates the removal of all roots and the planting of a mere stick, or as it has been aptly described, it consists of cutting off all the tops and all the roots and planting the label. As the roots are the life of the tree, it would seem the most rational, and the most in accord with nature, to leave as many as possible. All damaged and bruised roots, however, should be removed, after which the tree should be placed in position, the roots carefully spread out and covered with the loose soil. When the dirt has been placed over the roots, the young tree should be grasped firmly in the hands and shaken with an up and down movement so the dirt will settle around the roots, after which it should be tramped down.

The young trees should be cut off to fourteen or eighteen inches in height. And here is where many beginners, especially in the past, have made a fatal mistake. People are always in a hurry for results, and to the novice it seems reasonable that by planting a four or five year old tree and leaving all the top on, he will attain results much sooner than by planting a young tree and cutting off nearly all the top.

Experience has proven otherwise and we have learned that a healthy young tree, properly planted, and carefully looked after, will soon overtake and surpass the older trees and give better results for a longer period. The young trees should be cut back to a short stem in order to force them to branch low. This forms a low head and shades the trunk, a precaution much needed in our climate, as without some protection the trees will sunburn, and soon be filled with borers and become worthless. When the young tree is planted it should be protected from the sun until it has sufficient top to protect itself. This can be done by setting a shake before it, or using some of the tree protectors sold for the purpose.

There are several methods of setting out the orchard, the square, quincunx or hexagonal are the most general, and the square the favorite. These methods are illustrated as follows:

o o o o o
o
o o o o o o
Square Triangular or Hexagonal Quincunx

The quincunx is generally used where an orchard of large growing standard trees are planted, and the center one is put in of some early bearing variety to be removed when the others have grown to need the space, as walnuts or apples, with a peach in the center.

The distances apart at which trees should be planted vary with the nature of the trees themselves, the larger growing trees, of course, requiring more room. The following is the generally accepted distances allowed in this State:

Apples and apricots, 24 to 30 feet.
Pears and cherries, 20 to 24 feet.
Peaches, plums and prunes, 20 to 30 feet.
Quinces and dwarf pears, 10 to 12 feet.
Oranges and lemons, 20 to 30 feet.
Olives and figs, 20 to 30 feet.
Walnuts, 40 to 60 feet.

By skillful pruning nearly all kinds can be confined to a reduced space and this is advocated by some, but demands more than average qualifications.

In a family orchard, embracing various kinds, convenience in cultivating recommends the adoption of uniform distances adjusted between the extremes best suited to each. About 20 feet will be found a fair average. By alternating the larger growing kinds, such as apple and apricot, with the smaller, such as pear, peach and plum, each will more nearly appropriate its natural proportion of space.

The poultry exhibitions of California for this season are as follows:

Mechanics Pavilion, San Francisco, Cal., December 1-5, 1903, under management of the Oakland Poultry Association. J. C. Williams, Secretary, 33 Market St., San Francisco, or Fruitvale.

Los Angeles, Cal., December 14-19. 1903.—Twelfth Annual Exhibition Los Angeles County Poultry Association, to be given in Hazard's Pavilion. Comparison judging. Henry W. Kruckeberg, secretary, 123 S. Los Angetes St., Los Angeles.

San Diego, Cal., January 6, 7, 8 and 9, 1904.—The San Diego Poultry and Pet Stock Association. Harry McIntire, secretary, San Diego.

A Farmers' Institute will be held at Covina on the 28h of this month.

State Fruit Growers' Convention will be held at Fresno Dec. 8th.

A Farmers' Institute will be held at San Diego Dec. 3 and 4.

OF GENERAL INTEREST.

The Reciprocity Treaty.—Californians are not in favor of the passage of the Cuban reciprocity treaty. The Cultivator has, on several occasions, stated the reasons why the treaty as framed will be of great detriment to this state. We shall be brought into direct competition with Cuba, not only in the production of sugar, but in the cultivation of the citrus fruit industry as well.

Whatever can be grown in California can be grown in Cuba. And then, too, grown so much more cheaply, because labor there isn't one-third the cost it is here. This is the dangerous feature of the situation. We must compete with climate as good as our own, with transportation to our seaboard markets as quick as we can give; with the cost of production much less than this country can produce; and so, we are confronted, not by a theory, but by a condition, and that condition far from pleasing to contemplate. The treaty will probably be ratified, because the President is using his great influence to bring about the consummation of the matter, but in doing so California will be made to suffer greatly, for a time at least—though the President does not think so.

* * *

State Fruit Growers' Convention.—Arrangements have now been fully completed for the Twenty-ninth Fruit Growers' Convention, which will open at Fresno on the 8th of the coming month. More interest is being taken in this convention, and it promises to be the most interesting and the best attended one held for many years past. The first session will be opened by an address of welcome from L. O. Stephens, mayor of Fresno, who will be followed by Governor Pardee. Especial consideration will be given to the grape, and especially the raisin, which is now an object of great interest in the Fresno section. The question of co-operation in the marketing of fruit will also be an important topic, and both this and the raisin question will be discussed by some of the ablest men in the state; among them A. H. Naftzger, T. C. White, M. Theodore Kearney, Hon. Chester H. Rowell, Hon. A. M. Drew and others of equal prominence. The convention opens on Tuesday morning, on Wednesday afternoon an excursion over the lines of the San Joaquin Power & Electric Company has been arranged, while on Thursday evening a reception will be tendered the fruit growers by Ladies' Parlor Lecture Club, one of the most successful ladies' clubs in the state. Arrangements have been made for reduced rates at the hotels, while both the Southern Pacific and the Santa Fe will give excursion rates to those attending. The programme in full will be issued next week.

* * *

The packing-house of the Deciduous Fruit Association at Loara closed for the season on Tuesday. About one-half as many carloads were shipped this year as last.

* * *

A Mischievous Report.—Prof. A. J. Cook, writing the Cultivator in reference to the report that has gone out about squirrel poison injuring cattle, says:

"It is very unfortunate that several newspapers of the state are publishing statements to the effect that a squirrel destroying virus has been used by the professors of the university to inoculate squirrels in Contra Costa county. The report goes on to state that the virus caused a plague which not only destroyed squirrels but also caused cows to go blind. It is very strange how such absolutely false stories are started. The truth is that the university professors have never used any virus either in Contra Costa county or in any other part of the state. They have not now nor have they ever had any such virus for distribution, nor have they any satisfactory demonstration that such virus will kill squirrels or any other animals."

* * *

A Fine Compliment.—Prof. J. W. Mills, of the Pomona Experimental Station, has received a merited promotion. His field of labor being second only to Prof. Stubenrauch. Prof. Mills is fast winning first position among the authorities on fruits, soils, etc., in this state.

* * *

Bright Future.—The Fresno Republican rejoices, and it has a right so to do, at the prosperity which has attended the efforts of the raisin growers of that district. For a while back there was some discouragement in raisin growing based on the low prices received for the fruit. Now things are different. The Raisin Growers' Association has pretty well compassed the situation, and the prices at which they have fixed the crop for 1903 has made raisin growing profitable. The outlook for the Fresno district appears very bright.

* * *

Let Us Have Peace.—Gen. Grant's famous appeal to Gen. Joseph R. Hawley in 1868 has a ringing signficance today, when so much economic disturbance is prevalent in the land.

The following is the text of the letter:

"Peace and universal prosperity, as consequence with economy of administration, will lighten the burden of taxation, while it constantly reduces the national debt. Let us have peace."

The only cloud which disturbs the horizon of our future is that which is produced by the uncertainty of our economic conditions.

* * *

A New Industry.—Another valuable discovery has been made that means much for California. Heretofore mattings have come from Japan or China. Now it has been demonstrated that a splendid article can be manufactured from wild rushes that grow in California swamp lands. This idea was suggested by Rufus S. Sawyer, manager of an eastern matting company who saw how mattings were made in Japan. Prof. E. W. Hilgard sent a bunch of raw rushes to the Goodall Manufacturing Company, Kennebeck, Maine, which made a superior article from the grasses and pronounce the experiment a great success., The United States Bureau of Plant Introduction will at once establish farms in this State for the cultivation of the grasses.

* * *

An effort was made to induce the last Legislature to pass a bill authorizing the appointment of county stock inspector at a salary of $100 per month, and mileage at 10 cents per mile. Dr. T. Carpenter, city veterinary, of Alameda, and Dr. Funston of Oakland, claim the credit of defeating the bill. Now their names have been left out of the register of qualified practitioners, and these gentlemen ask Governor Pardee to investigate the matter.

* * *

One thousand people in and near Douglass, Kansas, have formed a co-operative association for conducting funerals of members. When a member dies an assessment of twelve cents is levied on each member and the expenses of the funeral to the amount of $120, are paid by the association.

* * *

M. Sergey Friede, who is one of the leading business men in Manchuria, was in San Francisco recently. He said it is a great mistake for America to oppose the occupation of Manchuria by Russia. The United States, especially California, will reap great trade benefits if Russia controls his country but if she does not it will be otherwise.

* * *

A great and useful discovery has been made by W. Pokell of Liverpool By immersing any kind of wood in a hot solution of sugar for several hours, and then drying it, it becomes hard an dstrong with powerful resistive properties to change of temperature or fire.

* * *

It having been asserted that beet sugar is not so sweet as that made from cane, the American Beet Sugar company, and the Los Alamitos Sugar man have issued statements offering proofs of the error of the statement and they make out a strong case.

* * *

The State appropriation of $60,000 for the development of irrigation, and the co-operation of the general government with the state, has created a lively interest in the subject. When the proposed irrigation works are finished the state will be many millions wealthier than now.

SAVED ONE LEMON GROWER $3000 IN A NIGHT.

J. P. Bolton's frost alarm has proven a success for one fruit grower in the Kings River country managing a large lemon and orange grove. He says it has saved him as much as $3000 in one night. N. W. Moody and a neighbor set one of the alarms and on Tuesday at midnight each was aroused by the continuous ringing of the frost bell. Mr. Moody says in a letter today:

"I have been up since 12:30 this (Tuesday) morning. The bell rang at that time, and I got four Japs out and began to smudge."

Mr. Moody was warned in ample time, and acting at once, saved the lemon crop from a severe frost, fighting which at the least calculation saved him $3000.—Fresno Democrat, Dec. 13, '03.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

BRAVELY SPOKEN.

One of the large fruit trade journals; which, by the way, is the official organ of the National League of Commission Merchants, recently contained an editorial defending itself for not attacking the California Fruit Agency. It seems that a number of the patrons of this eastern journal found fault with it for not condemning the agency for signing exclusive contracts with several Buffalo dealers. Answer to these strictures was made in no mincing terms. The principle was set forth that the agency had committed no illegal act in making contracts with dealers to buy exclusively from the agency's factors. It was set forth broadly that such contracts did no one injury, that they were open to all and were in accordance to business practice in all commercial circles. It is not often a commission trades paper takes such a broad view of the policy of an institution which in its execution necessarily comes in contact with the interests of a majority of the journal's patrons. It is for this reason that the Cultivator wishes to point to the fact that the California co-operators have a few well-wishers and friends even among the people who suffer loss of trade and prestige from the dominance of a mutual system of selling citrus fruits.

On the other hand there are a few violent enemies of the agency among the eastern fruit trade papers. They object principally to the loss in commissions caused by the division of fruit merchandising from the commission men to the salaried agents of the agency. These papers cannot be blamed for fighting for their patrons, but we must place their opposition as selfish, and therefore not in the interests of the fruit grower unless the commission system is the most advantageous to the growers' business. Events of ten years since have proved that ruinous conditions prevailed when the commission merchant had the California citrus fruit growers by the throats. No argument being needed while the memory of the commission men's dealings remains green, we may consider some other phases of the opposition.

The pleaders for the old order of merchandising fruit are located in a few centers of trade, and had grown into the belief that these centers had divine right of control. As an example, one of these centers had assumed to control the distribution of a certain fruit product of Central California. When an organization similar to the agency, though not so potent, attempted to interfere by establishing its own centers and methods of distribution it was informed that rather than see the distributing center interfered with the merchants of that great city would see that the distribution (the sale) of the commodity should be hampered in every way, even to stopping orders for the fruit generally, if necessary. That, and other threats and lines of opposition practically squelched the organization with its thousands of members, and we hear of it no more as a controlling factor in the marketing of its own products. Imagine the answer the California Fruit Agency would give to a mandate requiring the agency to cease the distribution of citrus fruits. Growers should rejoice in the fact that they have established an institution that takes orders from no one but themselves, and cannot be frightened or cajoled into taking any course adverse to the growers' interests. In acknowledging one friend in the ranks of the enemy the Cultivator does but simple justice to the Fruitman's Guide, for its words were bravely spoken and at a sacrifice to the standing of that journal among the radical commission men, from whom a part of its support comes.

We have fired the first gun in recognition of Panama's independence.

In China the soldier carries an umbrella and fan and rattle-box. In time of battle he generally gets rattled.

An Old Established Citrus Nursery in Good Location

A Description of W. G. Hall's Glendora Nursery, Where Trees Are True to Name

TO THE EAST of Los Angeles about twenty-five miles next to the foothills between Azusa and Glendora is a section where the perfection of conditions for producing citrus trees and citrus fruits are as favorable, we believe, as any place in the world. This is not our opinion alone, but first premium has been obtained by fruit from this section at the World's Fair at Chicago, also at the Mid-Winter Fair at San Francisco. This latter premium was on fruit which W. G. Hall of the Glendora Citrus Nurseries personally selected.

Further proof, if needed, is given in the financial returns which some of the growers of that vicinity have secured. For instance, two acres of Valencias netted the owner an average of a thousand dollars per acre for the past five years.

Sure it is that some of the most magnificent oranges we have ever seen, have been grown in that section. Firm, meaty, with but little rag, and of a flavor that would tempt the most fastidious lover of citrus fruits. This may be due to the climatic conditions which are so favorable, or it may be due to the conditions of soil and water; or it may be due to the excellent care which is given to orchards in that section, more probably it is due to all combined.

In any case, the fruit is proof of the possibilities of this section and these possibilities have led on to a development of orchard trees from seed-bed to bearing which are as fine as any we have ever seen.

One of the nurseries where these thrifty trees have been produced in exceedingly large numbers, is that of W. G. Hall the Glendora Nurseryman. Mr. Hall's Nurseries are located one mile south and west of Glendora on a beautiful section of sandy loam land, where his success has led to the increase in acreage until now there are many acres covered with seek-bed stock, or with stocky young trees ready for the budding, also with the choicest trees to be found anywhere ready for planting in the orchard.

Mr. Hall is a practical nurseryman of many year's experience and follows every step which the tree takes from selecting the seed for the seed-bed to the final balling of the tree for the orchard. His seed, carefully selected from large, thrifty seeds from the orchard of Dr. Dorsey in Los Angeles, are planted far enough apart in the lath house to give the stocky tree.

And by stocky we mean a tree which not only reaches a heigth of eight to thirty inches, as the case may be, but in girth at the base shows a size in good proportion with the heigth. Some of them are large enough, that so far as size goes, might be budded while still standing in the seed-bed. He guarantees all trees to be at least six inches in heigth, or if so desired, will guarantee not to be less than eight inches, and in sorting, all below this heigth will be thrown out.

Probably no one point in selecting trees for orchard planting is of greater importance than in securing trees the buds for which were selected with utmost care as to the trees being true to name. In this Mr. Hall has personally superintended, and has, as far as possible, personally selected and budded. Selecting the buds from the choicest trees grown in his section the growth of which he has observed for years.

Mr. Hall is ready to guarantee and does guarantee all of his own stock to be true to name.

As to freedom from any pest or disease, assurance may be had, that perfect freedom exists as to pests if any ever did exist in the nursery. Mr. Hall's practical experience for years in fumigation is such that he would readily secure perfect disinfection before removing trees from his place. His nurseries are ready for inspection at all times of the year, being kept clean.

In fertilizing, no quick acting, so called "stimulating" fertilizers are used, but such as are used to induce strong vigorous growth leave the trees in a healthy condition and enables them to stand the transplanting period with the least possible shock. This condition is proved by the dark green color and general appearance of healthiness over the entire nursery.

As to kinds of stock on which to bud citrus trees, Mr. Hall has no particular hobby, but at the same time advises the lesson of the experience of years of planting of orange roots. Of course, most of the old, tried and heavy bearing orchards of the state are upon the sweet seedling stock. This Mr. Hall maintains has proved a perfect success, and while not denying that some of the newer stocks may be proved as great or possibly of greater success, the general planter cannot afford to ignore the success which has been achieved by the sweet stock, or the possibility of disappointment which may come by heavy planting of stock budded on untried roots.

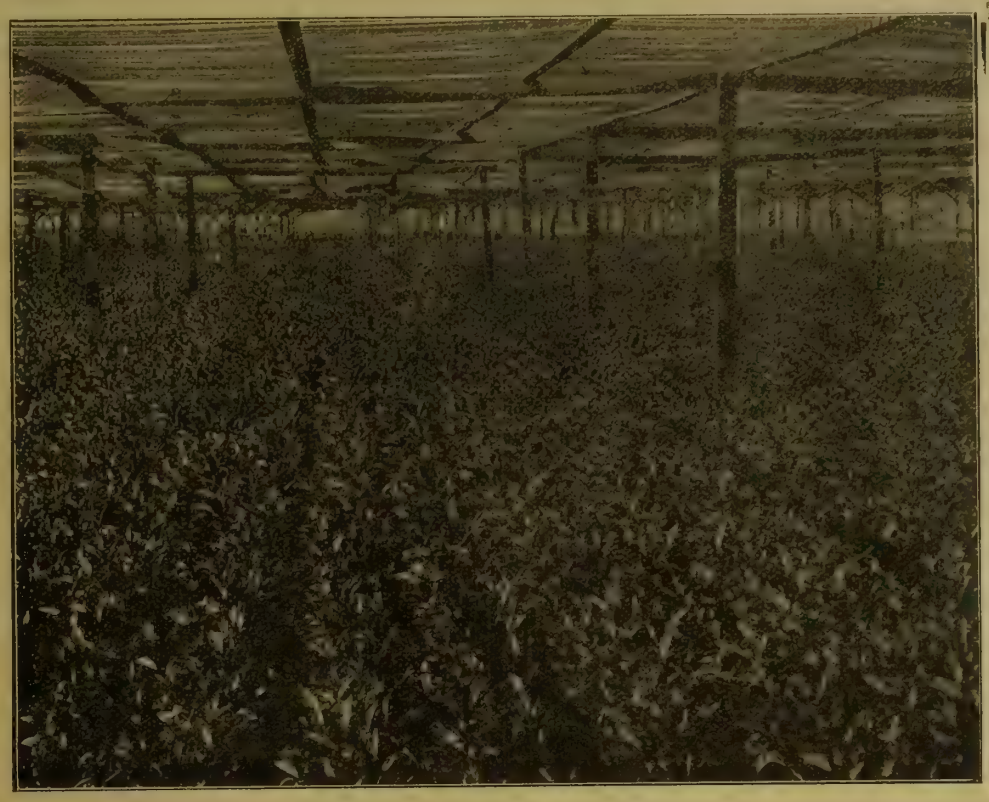
The budded trees now in nursery row are of a size and condition to attract the critical buyer. One year buds on two year roots with symmetrical head.

The care in selecting seed, buds and in growing thrifty seedlings and stocky straight buds is supplemented by the greatest care in taking the trees from the ground. Tap roots are cut as deeply as possible and each tree is taken from the ground with a large ball of earth and held in place by burlap.

The utmost care is used to place these on board cars in a condition to carry any rersonable distance.

"Trees true to name and grown for the grower" is Mr. Hall's motto and this he has lived up to for the past twelve years in which he has been dealing in nursery stock. He has made his stock a profitable investment for the planter. That's more interesting than talk. Same as a look at the nursery stock is much more satisfying than the dry reading on this page.

The nursery stock shown in the larger cut above was planted in April '02, bud ded Nov. '02, photographed Oct. '03



IN THE SEED-BED HOUSE.

TREES IN NURSERY READY FOR PLANTING.

LAND AND WATER

BY A. J. MCCLATCHIE, PHOENIX, ARIZ.

PEACHES FOR HOT DRY REGIONS.

A request from a correspondent at Wickenburg, Arizona, for information as to what varieties of peaches to plant there, where the trees may be obtained, and when they should be set out suggests a discussion of peach-growing in dry interior districts. In such regions not only are the summers trying, but frosts are heavier and more frequent during winter early spring than along the coast in similar latitudes. Consequently varieties should be selected that bloom at such a time as to escape as many of the early spring frosts as practicable and that will produce fruit of a good quality the succeeding summer. Injury from spring frosts may be wholly or partially escaped by either early or very late blooming; and a good quality of fruit may result from ripening during such a part of the season as to escape the extreme heat, or from an ability on the part of the tree to ripen fruit satisfactorily during hot weather.

* * *

Of the varieties best suited for warm regions, subject to spring frosts, several are of the Chinese type. Many varieties of this class bloom before the March frosts, and when the latter occur the young fruit is of a sufficient size to endure quite low temperatures. At the Station farm near Phoenix trees of this group seldom fail to bear a heavy crop of fruit. Of some varieties, however, the quality is not satisfactory. The most desirable varieties tested at the Phoenx farm are the Sneed, Greensboro, Waldo, Berenice and Sylphide Cling. The five ripen in the above order, covering the season from the latter part of May to the middle of September. The last is an excellent peach for hot regions, the quality being good and the tree very prolific. Dallas, General Lee, Thurber and Oriole are also fairly desirable varieties of the above type.

* * *

Of the Persian type, the varieties that bloom late and thus escape the March frosts are the ones that are the surest bearers, and those that ripen their fruit during fall are the ones that produce fruit of the best quality. The fruit of the early Persian varieties that ripen before the heat of summer is fairly good, though not quite up to the standard of cooler regions; that ripening during the heat of the summer is as a rule inferior, while that ripening during the cooler weather of fall is as a rule good. Among the best thoroughly tested varieties of the Persian type for hot regions are the Alexander, Governor Garland, Saint John, Piquet's Late, Columbia, Smock, Salway, Bonanza and Bilyeu's Late, naming them in about the order of ripening, the first maturing about the first of June and the last about the middle of November.

* * *

Of the above the Bonanza is an excellent variety from many standpoints. It is a very heavy and quite regular bearer, and the fruit is of excellent quality, ripening during October, just after Salway. Trees of this variety are not now offered for sale by California nurserymen, because it is said to have been found subject to curl and mildew. But as these diseases are unknown in the dry, hot interior valleys, there is no reason why its culture should not become general in them. A nurseryman began the propagation of trees of this variety near Phoenix some years ago, but the scarcity of water during the past few years has caused the nursery business to be so precarious in this region that, so far as known to the writer, none are now available for setting. Four-year-old Arizona-grown trees produced one hundred pounds per tree during the past season. The fruit was of a large size, showy, rich, and slow to deteriorate.

* * *

With the exception of the Bonanza, the Persian varieties mentioned can be obtained of California nurserymen. Many of those of the Chinese type are not offered for sale in California, but can be obtained of the well-known nursery of P. J. Berckmans Company, Augusta, Georgia. A large percentage of the varieties propagated at this nursery has proven especially desirable ones for the region about Phoenix.

* * *

Trees are set out during February, the earlier during the month the better, most seasons. It is important that they be set just at the beginning of the growing season and that every precaution be taken to prevent the tops drying out before or just after setting. They should be irrigated soon after being set out, and need frequent irrigation throughout the first season. As the trees get older, a larger percentage of the irrigation water may be applied during the winter, and less during summer.

* * *

TREES FOR THE VALLEY OF THE COLORADO.

From the physician at the Fort Mojave Indian School and from the Imperial land owner come requests for information as to what Eucalypts or other trees are likely to do best in these regions. The summer heat is so great there that it is doubtful if any rapid-growing Eucalypt will thrive. E. polyanthema ought to grow, and it would be well to try E. rudis, E. tereticornis anl E. rostrata.

The cottonwood is sure to thrive in these hot regions, if supplied with plenty of water. It may be propagated from either seed or cuttings. If the former are used, half of the resulting trees will ordinarily be females, and will produce the cotton that is so annoying to the farmer during spring. By taking cuttings from male trees, this objectionable feature may be avoided. The size of the cuttings is not important, the majority of the cottonwood trees growing in the vicinity of Phoenix having started from fence posts.

For a deciduous shade tree in very hot regions, none is better than the Texas umbrella. If supplied with sufficient water, it will not only endure but flourish in t he hottest weather of summer. The early growth is injured by late spring frosts and the leaves fall soon after the first frosts of autumn, but during the warm part of the year the foliage is abundant. It is a dark rich green, very pleasing to the eye in an arid region where so much of the mature foliage has a grayish hue. The trunk of the tree is short and the branches small, the wood produced being thus scanty—and furthermore it is of a poor quality; but for shade and ornament the tree is a very useful one in hot regions.

The olive grows well in these hot interior valleys, and makes an attractive as well as a useful shade tree. In the vicinity of Phoenix, the Navadill is one of the fastest growing and most prolific varieties.

Authorities in England estimate the requirements of the wheat importing countries for the current cereal year, at 62,000,000 quarters of a ton.

SUGAR PRUNE AND PHENOMENAL BERRY.

Editor Cultivator:—Will you please inform me through your paper what kind of prune the Burbank Sugar is, and where one could get the trees? Also what difference there is between the Logan and Phenomenal berries. I have the Logan, but never heard of the other till I read of it in last week's Cultivator.—Isaac Martin, La Costa.

The Sugar prune is the sweetest prune grown. It ripens about a month earlier than the ordinary French prune and is about three times as large. It contains about 23 per cent sugar in the fresh state as compared with about 19 per cent in the French prune. It is about the same color as the latter and a little nearer round in shape. It is considered a very valuable acquisition in the northern prune districts. After three years' trial, after it had reached the bearing stage at this station, we marked it down as a failure with us. It did not bear as well as the Prune D'Ente or the other strains of French prunes, nor was the fruit as free from blemishes. Its chief fault here was that it invariably cracked open. Our specimen was grafted on a very vigorous Damson tree and had the whole tree to itself.

Trees of the Sugar prune may be bought from any of the nurserymen who advertise in the Cultivator.

The Phenomenal berry was originated by Luther Burbank in the early nineties and following is his description of it furnished us by Prof. E. J. Wickson. "Larger than the largest berry ever known before, of bright crimson raspberry red color, productive as could be considered and the most delicious of all berries for canning and drying; berries grown in clusters of from five to six or more and individual berries often measuring three inches around one way by four the other, and weigh one-fourth of an ounce each, even larger ones have been weighed and measured." John Lewis Childs of Floral Park, New York, bought Mr. Burbank's entire stock of this berry and some of them have been sold in California. J. L. Childs gave it the name of "Phenomenal." During the last few years it has given good satisfaction and is preferred to the Logan berry by some people, it being less acid and of fine flavor, making it desirable for table use. We suppose that plants of it can be secured from our nurserymen. If they do not keep it in stock, they can secure it or you may send to the above address.

* * *

BERMUDA GRASS.

Editor Cultivator:—As I am much interested in growing grasses, would you tell me if the grass known as Bermuda grass is an imported grass or a native of America, and do you know where I can get the seed, and about how much it takes to the acre?—A. Frinchaboy, Los Alamos.

We have been unable to find an authority who is willing to give the nativity of Bermuda grass. There are four species of it, the one so common in California being Capriola dactylon (called by some botanists Cynodon dactylon). This plant propagates easily from the seed under favorable conditions, but it does not under unfavorable conditions. The best way is to secure the roots or even the grass itself, cut them up with a hay cutter and sow the chopped stuff broadcast and cultivate it in immediately. The best time to do this is immediately after a rain, or better still, just before one if it can be definitely known when that will happen. If the grass or roots become dry they will not grow. The grass can be found almost anywhere within the boundaries of this state. It is almost always found growing along open irrigation ditches and along roadsides. The best way to get a start of it is to travel around the country, provided you have none at home, dig it and sack it up. There will be no difficulty in finding farmers who will be perfectly willing to allow you to do that.

IDLE PEARS AND CHERRIES.

Editor Cultivator:—I have a large cherry tree and also a large pear tree that bloom full every year but do not bear anything. Can you tell me what to do for them to make them bear?—E. P. Upland.

The information is a little too meager to enable us to make a very close guess as to the trouble. Had we the names of the varieties, or if the trees are isolated, a satisfactory answer would be much easier to give. It has been our observation that cherry trees of the Rigarreaux and Hearts bear late in the valley. The trees blooming profusely without bearing until they are about ten years old, after which time they bear satisfactory crops. We know of no way to make them bear younger unless by root pruning. This can be done by digging a trench on two sides and severing a few of the smaller roots that branch from the main roots. We do not advocate this method for this climate and especially where abundant irrigation is required. We believe that they need all the roots that they can grow. Root pruning is sometimes practiced where the growth of the trees is so vigorous that the energy of the tree is thus used instead of bearing fruit.

As to the pear tree, we suspect that the bloom is not fertilized properly. Some varieties never bear with us, while others do better under some conditions when cross polinated by another variety. This is quite true of the Bartlett.

* * *

INFLUENCE OF STOCK ON SCION.

The results of recent experiments and observations recorded by the Academy of Science at Paris, show that pears grafted on quince yield more abundantly, and better fruit is produced than when grafted on pear seedlings, and causes of the phenomenon are explained. It seems that more material is concentrated in the trunk and branches of a pear tree grown on quince than in one grown on a pear seedling. When the growing time comes in the spring, the tree is better able to contribute starch and as a consequence, more fruit is the result. Having a good and vigorous start from the beginning, larger and finer fruit is the result. No explanation of the cause is given, but it is found to be a fact.

Pears on quince is all right as far as they go, but for a permanent orchard, standard trees are much more desirable. When it is an object to raise a quick crop between the rows of standard trees, which must be at least 25 or 30 feet apart, the spaces may be planted to dwarf trees. These will bear the second year and may be removed by the time the standard trees come into bearing.

There will no doubt be many acres of Bartlett pears planted in the near future, as that variety was pretty well cleaned out in some sections by the blight during the past four or five years. The blight seems to have run its course to a certain extent and growers have learned to check its ravages to a large degree. Some Bartlett pear orchards which seemed to be doomed have been saved with comparatively little loss. Quick and severe cutting back and burning of affected branches as soon as the first sign of the disease shows has done this, practically eradicating the disease from some orchards.

A new olive oil plant has been started in Santa Ana on a large scale. Mr. Cherry is building the largest oil pressing machine in the state to be used in this plant.

BY J. W. MILLS, ONTARIO, CAL.

STABLE MANURE FOR ORANGES.

During the past month, several orange groves that have come under our observation have been heavily fertilized with stable manure. According to the judgment of the most careful growers, this is a mistake. It is very apt to start a new growth when trees are inclined to do so, as is the case during some seasons, but the chief objection is in the effect that it is apt to have on the fruit. Puffy fruit is much in evidence some seasons while other seasons it is almost unknown. Just why this is so has never been clearly explained, but it has been noted that trees which have been heavily fertilized with stable manure and other nitrogenous fertilizers while the fruit is still growing and just before it colors, becomes more puffy than fruit on trees not so treated. When the natural conditions occur which produce puffing, fruit which has received late fall or early winter applications of available nitrogenous fertilizers, seems to be more injured than fruit which has not received it at those times. Another disadvantage is that the winter rains wash a large amount of the elements containing the nitrogen in liquid form, beyond the reach of the great mass of the feeding roots.

* * *

A neat book on fertilizers by Carrol B. Smith has just reached us, and from its contents we believe it will be of much benefit to orange growers. It lays down the principles of fertilization as far as the science is now known, and we are much pleased with it. While Mr. Smith sells fertilizers, he is primarily an orange grower and an agricultural college graduate. He has the subject well in hand and gives in a few words what would take much time to gather from agricultural reports.

FINE NURSERY STOCK

We are now opening our sales yard at No. 632 S. Spring St., Los Angeles. We will soon have on hand a full line of northern as well as home-grown Deciduous Trees in quantity. Also some of finest Citrus Trees grown in the South. Having had between 26 and 80 years' experience in fruit and tree planting, we are enabled to offer suggestions as to best and most profitable varieties for Southern California. Ornamentals and Trees for street and lawn planting. Yours truly,

STEWART BROTHERS

632 S. Spring Street — Los Angeles, Cal.

NO EXCEPTION

Last year we said the Tilton Apricot was a regular bearer. NEVER FAILS. This year is no exception. Every tree bore heavily; old ones as well as the newer planted orchards.

and still the

TILTON APRICOT

Is a winner. Large, highly flavored, good color. In the dried fruits the Tilton won First Premium at the Great Central California Fair. Liked by canners. Original tree 18 years old near our nursery. Buy trees where you can get true to name buds from original stock from the Original Tilton Nurseryman. A thrifty lot of peaches and other deciduous trees.

J. W. BAIRSTOW, HANFORD, CAL.

Fresno Nurseries

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

We call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

CALIMYRNA FIGS

(Genuine Smyrna Fig of Commerce)

The only Fig that is fit for commercial purposes. It has proven a grand success in California, and orchardists should not hesitate to plant liberal acreage. **"The Smyrna Fig at Home and Abroad,"** by Geo. C. Roeding, 87 pages illustrated, sent postpaid, 25c (stamps).

Contracts made now for delivery 1904.

Deciduous, Citrus and Ornamental Trees and Rose Bushes.

Finest and most complete Nursery Catalog published mailed for five cents postage.

RESISTANT GRAPE VINES

Sole agents in the United States for largest Nursery in France growing Resistant Grape Vines. In addition to this we are also large growers of Resistant Grape Vines ourselves. Quotations given on rooted Resistant Grape Vines, grafted to the leading varieties of table and wine Grapes. As we handle in car lots we can make very low prices.

PAID UP CAPITAL, $200,000

FANCHER CREEK NURSERIES Inc.

GEO. C. ROEDING, PRESIDENT AND MANAGER

P.O. BOX 14 — **FRESNO, CAL.**

Conducted by PROF. A. J. COOK, Claremont, Cal.

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

It will be remembered that we separate the class of insects into orders by noting the wing characters, mouth parts and transformations. Today, we have to do with the ubiquitous thrips. I know of no insect which has a wider range or is more numerous than are these innumerable insects of the thrips order. From the great damage which the thrips have done in our citrus orchards for the past year or two, this order is of no mean importance and will be studied with no little interest by our orchardists. We can hardly go amiss of the thrips. Hardly a flower but serves them for a home and food, hardly a leaf that does not furnish them a playground, hardly a twig where we may not see them on promenade. Although there are but few species, they really make a host, and as we consider their numbers, we can not wonder that they may work havoc.

Linnaeus placed these with the bugs in the order Hemiptera. I think there is excellent reason for removing them from that order and placing them in an order by themselves. As they all have long, slim, simple fringed wings, the name of Thysenoptera which has been given to them seems most appropriate. This word means tassel-wings. These long slim wings lie on the back of the insect when not in use. The fringe, while it adds not much to the weight, does add to the wing expanse. The mouth parts, too, are different from the bugs'. In structure they are more like the mandibulate or biting insects, though they are quite modified from the insects of every other order. Functionally, however, their mouth parts are haustellate, that is, they suck. The transformations, too, mark them as peculiar. While they seem incomplete in their transformations and do not look much alike in all stages, yet the pupa is inactive.

Thus we see that these thrips are betwixt and between, both as to mouth parts and as to transformation and are well worthy a place in an order by themselves.

There is no doubt but that the thrips do immense damage. True, most of them are exceedingly minute, scarcely more than one-twenty-fifth of an inch in length, yet they are countless in numbers and it takes much to feed so many mouths. Thrips are very long narrow insects. The antennae are quite distinct as are the eyes. The number of joints to the antennae and the number of hairs on them serve well in classification. These insects are also curious in the ends of their feet. Instead of the usual claws, the feet end in a sort of bladder which, by distension, they are enabled to hold onto objects on which they walk. It is interesting to watch these in a microscope on a glass slide and to note the curious manner in which they manipulate these bladder like feet. Some have called the order Physopoda, which word means bladder-feet.

We have black, yellow and orange thrips abundant in Southern California. Some of our friends think that the black thrips feed upon other insects and thus may aid in keeping the black scale in check. I have yet to see positive proof of this. The yellow thrip, which has done so much damage in the citrus orchards is Euthrips tritici. As we would expect, it does very little intrinsic value to the fruit, as from its size it can affect only the most superficial cells, yet the injury is sufficient so that the fruit is badly spotted and thus is wholly ruined for market. Indeed, the injury is so slight that only the sharpest eyes can note it as the fruit is picked, and as the fruit is left on the tree so that it can continue to receive sap, it entirely recovers from the wound, so that no spotting is in evidence; but if the fruit is picked and the lemons placed in the curing house and the oranges put in the cars for shipment, in from one to three or four weeks the spots turn brown and become very evident and thus the fruit, though really uninjured, is so disfigured that no purchaser would take it.

Without doubt there are some insect enemies that prey upon the thrips. Heavy dashing rains will destroy them by the millions. I have no doubt but that in the use of distillate spray we will destroy these despoilers in extenso. From the fact that in previous years this spotting by thrips has been observed hardly at all, leads us to hope that the raids upon our orchards the last two winters was because of some peculiar seasonal characteristics and that we shall not in the future be so much troubled. Mr. Frederick Maskew has recently observed that guavas are injured in many places. Examination shows that where the fruit is injured, thrips are very numerous, while upon other shrubs where no injury is noted there seems to be an entire absence of the insect. It is possible that our thrips misery has yet only dawned upon us.

* * *

FARMERS' CLUB INSTITUTE.

This great annual meeting which will occur at San Diego December 2-4, bids fair to rival any of its predecessors in interest and importance. It will commence Wednesday, p.m., and close on Friday. Important themes will be presented by many of our strongest men and the program will be one of the richest we have ever had. Mr. R. C. Allen, who is chairman of the committee of arrangements writes me that the local interest is very great, and he believes we will have a local attendance equal to that of the Pomona meeting. A banquet and a boat-ride on the bay are among the attractions. Those to be present who will engage in the discussions and read papers will be Messrs. Teague, of Santa Paula. Mr. Braunton, and Goodrich, the strawberry king, of Glendale and Tropico, respectively, Dr. Gates, of Pomona College; Horticultural Commissioner Pease, and Dr. Reid and Mr. Hoffman, and we also hope Mr. Edwards of San Bernardino county; Messrs. Mills and Little of the celebrated Arlington orchards, and J. H. Reed, also of Riverside county; Hon. Edward M. Camp of Los Angeles; C. C. Chapman and Prof. Pierce, of Orange; and Messrs. Austin, Copeland, Allen and Prof. Culbertson from San Diego county. We had hoped for Mr. Hamilton of the Department of Agriculture, but fear he will be unable to be with us. There is a chance, however, that Mr. W. A. Taylor, of the department, a graduate of the Michigan Agricultural College, who is an expert in pomological matters, may be with us and aid us in our discussion. Dr. and Mrs. Sherman, of Fresno, who did so much for us in our late institutes and were such good help in the Seaside Institute, will both be on the program. It is hoped and expected that Prof. Wickson will be present. Every club should arrange at once to send a good delegation. In this way the fruits of the meeting will be broadly distributed and the clubs will gain new interest from the inspiration which will come from a full report of the proceedings of this meeting. It will be remembered that the state meeting of the Horticultural Commission will occur the next week at Fresno. It is the writers' intention to be present at that meeting and he hopes that a good delegation will go from Southern California.

An effort is being made to secure a full report of the San Diego meeting. This matter of report is one of exceeding interest and importance and it is hoped that Prof. Wickson will come with something of value in this connection. There is a widespread desire that we should have a complete report including discussions of our two great meetings, the Farmers' Club Institute and the Seaside Institute. I hope the various clubs will discus this matter and come to us rich with suggestions as to ways and means.

* * *

COCKROACHES IN THE CELLAR.

Mrs. McDaniels asks for something to exterminate an insect which infests her cellar She says it is dark brown and about one half inch long and gives off a rank odor. They are abundant under boxes and boards and when exposed dart away and disappear as by magic. Those who have read my A B C of Insects carefully, and I hope all of our readers have done so, as an elementary knowledge of entomology is very helpful in almost any line of life. will at once detect the above as the common cockroach, which belongs to the locust and cricket order. These flat insects frequent cellars and sugar refineries and are often quite a pest. There are two ways to exterminate these pests of the cellar. A liberal use of insect powder, dusted about their haunts will soon use them up. The same can be done by administering poison. Bran sweetened with syrup and poisoned with arsenic or other poisonous insecticide is a sure remedy. I always give this last with hesitation as I fear accident from the careless use of such poisons.

* * *

FLORIDA BULLETINS.

Mr. R. asks if the Florida bulletins would be especially valuable to the California orchardists. Of course they will be. I prize them highly. True, Florida is a humid region and so management must be very different from that which we give in an arid clime. Yet they grow citrus fruits and have much in common with us, and so the bulletins of the two States ought to be mutually helpful.

* * *

ALKALI.

Mr. R. also states that along the edge of his water ditches between two groves, after the water stops running and the ditch becomes dry, a white substance that looks like alkali appears at a level about two feet below the surface of the ground. Below this, about three feet down is the hardpan. An analysis should be necessary to state just what this salt is. It may be one of the elements of our alkali. This is certainly the most probable explanation of this incrustation. Mr. R. should send some of this to the University for analysis, so that he may know whether it is white alkali, black alkali, or common salt.

THE FARMERS' CLUB INSTITUTE.

Prof. A. J. Cook announces an institute to be held at San Diego, on the 3 and 4 of December. The programme is quite lengthy and embraces the names of some excellent men and women who are to take part.

WANTED—Reliable, sober, middle-aged, single man for ranch work. One with experience in fruit and gardening, and not afraid to work. Address MRS. OSSINA LOW, Box 61, Glendale, Cal.

WANTED—A GOOD LOCATION for Bees convenient to Los Angeles. Address J. H., CULTIVATOR OFFICE.

GO TO GARDENA

Where the alfalfa grows so luxuriantly, giving from 6 to 8 cuttings per year, and producing when fed to cows a superior product of milk and butter—the secret — there being no alkali to detract from the purity of the milk, as demonstrated by the noted Strawberry Brand of Butter made by Mr. Davis of Gardena. The success of our Chicken Ranches depends upon having green alfalfa as a food product in the production of eggs at a time of the year when the dry ranch farmer has no green feed to make the hens lay. Our small alfalfa, dairy and chicken ranches are making good livings.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 16 ACRES, $7,700.

A profitable farm with 6-room house, 2 large barns, chicken houses and corrals. Good bearing apple orchard, interset with Loganberries; 9 acres set out in young walnuts; ½ acre peaches; ½ acre raspberries; ½ acre strawberries; 1 acre rhubarb; 1 acre young vineyard; 2½ acres in alfalfa, and 8 acres to be seeded to alfalfa.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, seeas, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 29 ACRES, $12,000.

One-half mile frow two electric car lines Seven-room honse, barn, corrals, pasture, 17 acres alfalfa, 4 acres of strawberries, family orchard (all fenced) with a good pumping plant.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house and barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

Coast News and Notes

BY R. A. DAGUE, COR. SUTTER AND SANSOME STS., SAN FRANCISCO

HORTICULTURE.

The olive crop this year is good.

It has been demonstrated that Kings county grows soft-shell walnuts very successfully.

Navel oranges from Oroville and Poterville, were shipped into San Francisco on the 11th of November.

The Vrooman ranch, near Santa Rosa, this year, produced three tons of very fine French Farquette walnuts.

Two thousand tons of prunes is the output around Hollister this year against 3000 tons last season.

I. N. Davidson, near Porterville, will gather this season about 1,000 boxes of lemons from his orchard of 3½ acres.

S. P. Woodworth, of Stony Point, Sonoma county, has this season shipped 1,800 boxes of fine Spitzenburg apples.

The Southern Pacific and Santa Fe estimate that from this time on they will ship 200 carloads of oranges per day.

W. R. Fuller, of Tampa, Florida, says the Florida crop of oranges, this year, will be 1,600,000 boxes against 750,000 boxes last year.

The Pacific Coast Fruit Packing Company, stocked at $50,000, has been organized at Oakland. It will soon begin erecting buildings.

The total shipments of fruit this season made by the California Fruit Distributors, at this writing, were 7,315 car loads as against 6,990 of even date last year.

J. M. Zion, an Indiana horticulturist, says his greatest ambition in life is to produce a 20-inch apple. He is experimenting and thinks he will soon succeed.

Two hundred and fifty cases of Washington Navel orange trees have been shipped from the San Dimas nursery, to six experimental stations in Italy.

The fruit growers of the Pajaro valley have banded together and built an electric railroad to the coast and put on a steamer to carry their fruit to San Francisco.

The coming orange crop of California is estimated at 35,000 car loads and growers are anxious to know whether the market can be stimulated to consume them at profitable prices.

The Red Banks orchard company, with a capital stock of $125,000, has been organized at Visalia. The orchard is twelve miles east of Visalia. Eighty acres are now planted to nursery stock. Citrus fruits will be largely planted.

The Hanford Sentinel, after calling attention to the great success Mr. Rafailovich has attained in raising the White Adriatic figs, says: "The fig industry is greatly neglected here, and yet that fruit grows to perfection in Kings county.

Up to November 14th, there have been received by the Fresno Raisin Association, 46,000 tons of raisins. This is 550 tons in excess of last year's total deliveries. The price paid is $3.13 on packed out goods. This has amounted in money to $2,400,000.

The method of crossing two fruits, says Marcus Woodward, is simplicity itself. The horticulturist merely takes the pollen from the flower of one specimen and dusts it into the stigma of the flower of another specimen. The result is a hybrid.

Tom Davis, 16 miles northeast of Visalia, says that while it is known that generally Valencia oranges are picked in May, he has a peculiar experience with his Valencias. Last year they ripened in November. He gathered a few out left many on the trees. In the spring they turned green. This fall the fruit turned yellow again ,and is sweet and delicious.

AGRICULTURE.

The Quinby Brothers of Angiola, Kings county, have been experimenting on growing rice. Although the experiment was made on a small scale it has been a decided success.

The late experiment to raise cotton in Liberia has failed because cotton will not grow there.

The farmer has the advantage that people cannot enjoy who live on food from paper bags. He can know what he eats.

The beet raisers of Southern California recieve each year over one million dollars for beets.

A farmer of Meridian, Sutter county, broke up 30 acres of raw tule land this spring, on which he raised $2,455 worth of beans.

It has been figured out that a ton of California corn carries 22 per cent of cob or 440 pounds of cob to the ton of corn in the ear.

Ordinary years Minnesota raises an abundance of potatoes. This year they are being imported from the Dakotas.

Kings county comes forward with the claim that chestnuts, walnuts, pecans, peanuts and almonds are easily and profitably grown there.

The bean market is stiffening up a little in Ventura and Santa Barbara counties. At this writing limas are firm at $2.50; black eyes at $2.00.

Grain dealers in San Francisco have received information that the wheat crop of Argentina, S. A., is splendid. There will be 2,500,000 tons for export.

A few days ago Farmer & Peterson, of Sonoma county, contracted with William Uhlman & Co. to sell the latter their hop crop for the next five years at 12½ cents.

C. R. Scott, of Tulare, enjoys the distinction of being the first man to introduce in California a new forage plant called Teosinti which much resembles Indian corn.

The largest cargo of flour ever floated, left Portland the 7th instant for Oriental ports, on the steamship "Algoa." She had on board 85,270 barrels or 20,000 more than was ever loaded on a ship.

Dwight Griswold, the "strawberry king" of Tropico, will represent the Tropico Association at the Farmers' Institute at San Diego in December and will read a paper on strawberry culture.

There is now on exhibition at the rooms of the State Board of Trade, four clusters of Verdel grapes that weigh twenty-nine pounds. They were raised by Louis Mell, of El Mocho. The grapes will be sent to the St. Louis Exposition.

Fresno grape growers say they are secure against a scarcity of laborers hereafter. Large numbers of Armenians, Russians, Danes, Germans and 1000 Japanese have settled in that vicinity. All have large families except the Japanese and the children work in the vineyards.

Co-operation and combination seem to be triumphing all along the line. The Raisin Co-operative Association, of this state, so manipulated the market, that outsiders have been so vigorously squeezed, that many of them seem to be anxious now to get in the combine.

The Oakland Enquirer says it has been demonstated many times that the Agricultural Department of the State University is worth to the public more than it costs to maintain it. It adds: "Chicken cholera may not have as high sounding or dignified a name as some of the subjects studied at Berkeley, but it means prosperity or otherwise to a good many people in Central California."

LIVE STOCK.

A pigeon farm has been established at Goleta. The owner has 4000 birds on hand.

A few days ago the Cutter Brothers of Visalia sold 100 beef cattle at eight cents.

W. C. Greene, president of the Greene Cattle Company, has bought the San Rafael ranch in Arizona of 300,000 acres, and many hundred head of Hereford cattle. The price paid for ranch and stock was $1,200,000.

Coast News and Notes

CONTINUED

The stockmen in the Alexander and Wrights valleys, Sonoma county, have lost many cattle from a disease they call scours.

For the week ending Nov. 3rd, there was shipped from Petaluma to San Francisco 24,732 dozen eggs and 568 dozen poultry.

The annual egg output of Petaluma has been estimated at 2,200,000 dozens. The output this year will reach 5,000,000.

The annual egg crop of the United States has reached $300,000,000. Except wheat, corn and hay, the egg crop is the largest.

Geo. F. Farmer of Kings county has recently lost $1000 worth of hogs that have died from the disease among the swine in some localities this fall.

State Veterinary Surgeon, Dr. C. H. Blemer, investigated the cattle disease in El Dorado county. He thinks the sickness is caused by a poisonous weed the cattle have eaten.

Dr. Ward, assistant professor of Veterinary Science in the University, denies that the recent death of cattle in Contra Costa county was caused by squirrel poison recommended by University professors.

Dr. Frank Griffith, live stock inspector of King county complains that diseased cattle have been sent into that county from Santa Barbara, San Luis Obispo and other coast counties.

MISCELLANEOUS.

A fine article of sugar can be made from the banana.

The Southern Pacific company has bought out the San Joaquin oil company. Price paid $840,000.

A dam 45 feet in height and 1000 feet in length will soon be completed at Nimshew.

There are now 1,500 male convicts and 21 female convicts in the penitentiary at San Quentin.

A colony of 300 Swedish people has decided to remove from Lindsburg, Kansas, to Fresno county, Cal.

The German empire and the United States Government are to have competitive exhibits in forestry at the World's Fair.

Col. A. W Hamilton, of Mt. Sterling, Ky., will be the presiding Judge at Ascot Park, Los Angeles, races which begin Dec. 24.

There will be two vineyard experimental stations established in Sonoma county. One will be near Sonoma, the other at Geyserville.

The output of the Oregon State salmon hatcheries will exceed 30,000,000, while the government plants will add 15,000,000 more.

The Board of County Supervisors of Sonoma county has prohibited automobiles from running to exceed twenty miles an hour on the highways.

The value of the total amount of sugar exported by sea from San Francisco during October amounted to $262,135.

Fire has kept out of the hills back of Livermore, in consequence of which many thousands of sheep have a good growth of grass and are getting fat.

The Duke of Bedford, the leading fruit dealer of London, gives Mr. Block of Santa Clara county, California, the credit of shipping the best fruit to London.

Governor Pardee recently remarked that the Sacramento valley has 6,500,000 acres of land that can be irrigated. That valley alone would, if irrigated, support 10,000,000 people.

Alex. Craw has asked for shipment of black scale from Southern California, to be used in feeding the Scutellista in the breeding cages in his rooms.

Co-operation seems to be the order of the day. The most successful association of this sort among California producers is probably the walnut growers.

Capt. S. G. Brooks, agent of the Southern Pacific Milling Co. at Santa Paula, handled during October, 27,065 sacks of produce weighing 2,165,220 pounds.

There are now in the California asylums for the insane, including the inmates of the home for feeble minded, 6104 patients.

The Santa Fe comapny has given a lease for 20 years to land in Stockton on which will be erected a $50,000 plant to manufacture starch, albumen, face-powder, glue, gluten, cereal foods and other by-products.

The people of the United States imported and consumed in the fiscal year just ended, sugar to the amount of $100,000,000 in value. Porto Rico and the Hawaiian islands furnished one fifth of that amount.

The location of the experimental Government Stations have now all been determined as follows: At Sonoma, Geyserville, Oakville, Fresno, Cucamonga, Livermore, Mountain View, Lodi and Concord.

The Santa Rosa Republican gives it as its opinion that in time the power furnished by California mountain streams will become more valuable than all the gold that has been washed from these same streams.

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

LUMPY SKIN.

Editor Cultivator:—I have a young horse that is driven a little every day, he eats well, looks well, but has some small lumps come under the skin. Will you kindly tell me cause and treatment for same.—S. W. Taylor.

Caused by an unhealthy condition of the skin, blood and circulation. Take of powdered nux vomica, potassium iodide and hyposulphate of soda each one ounce. Make into 16 powders. Mix one in the feed once a day.

* * *

Editor Cultivator:—I write to ask you if you would give me some information for the cure of bots. I have lost several yearling colts within the last month, and when I cut them open I found the opening from the stomach into the intestines completely choked with bots, and in one case the stomach was perforated in several places by the bots.—A. A.

The bot-fly deposits its eggs on the hairs of the shoulders, breast and front legs of horses running at pasture in the latter part of summer. When the horse licks these parts the warmth and moisture of the saliva hatches the eggs, and a certain portion of the small larvae pass with the food into the stomach, where they remain until the next spring, when they pass out with the excrement. If it is where they can, they bury themselves in the earth, where they remain about six weeks in the pupa stage, then they come out as a flull fledged gadfly, live only a few weeks while depositing their eggs, then die. They remain about eight months of their lifetime in the digestive organs of the horse. While in the stomach of the horse they do not create the amount of disturbance that they get the credit for. They attach themselves to the walls of the stomach by two little hooks, and obtain their nourishment by suction. They have no organs by which they can bite or bore, so it is a physological impossibility for them to penetrate the walls of the stomach. Scrape the eggs off the hairs of the horse is a good preventative. Their presence in the stomach of a horse at the time of his death frequently causes them to get the credit of killing him, when it was caused by something else.

TOLUCA NURSERY

Blackberry, Raspberry, Loganberry, Strawberry. Full line of Nursery Stock.
TOLUCA NURSERY
G. TEOSETTI TOLUCA, CAL.

STRAWBERRY PLANTS

500,000 plants of all the leading varieties, GROWN FROM PEDIGREE STOCK. Interested parties invited to visit our place and see Brandywine and Belts in full bearing.

NO, NOR COPYRIGHTED.

Editor Cal. Cultivator:—Enclosed find one dollar for renewal of my subscription to the California Cultivator. This is one Cultivator that thoroughly cultivates the field for which it was designed, gives entire satisfaction and is not patented. Yours truly.—L. Martinelli.

The above is only a sample of letters in our daily mail from Northern California, from Central California and from Southern California. The growth of the Cultivator is continued by just such appreciation as is here expressed. That feeling of confidence in the Cultivator is an important factor to advertisers. That is why we get such letters as this:

San Dimas Citrus Nurseries, growers of true to name citrus trees exclusively.

SAN DIMAS, Cal., Oct. 26, '03.

Cultivator Pub. Co., Los Angeles, Cal.:—We beg to call your attention to the fact that the Cultivator has always given us the best of service. We have used it many years, and for the last two or three especially it has given us better results than any other of our advertising mediums. Whenever we wish to dispose of anything in our line, we can always find purchasers by using your columns. Wishing you the best of success, we remain, yours very truly.—San Dimas Nurseries, R. M. Teague, Prop.

* * *

Besides, that is why we have to purchase almost a ton of white paper each week on which to print the edition of Cultivators. Fact, for it now requires something over 1500 pounds of white paper. Piled in single thickness paper before folding, it is almost as high as a man stands. After wrapping and addressing on Friday mornings the eighteen to twenty large mail sacks make a good two-horse dray load.

* * *

Yes, the Cultivator do grow. The pleased expressions of advertisers prove that they are abundantly satisfied. The advertising columns are something of a proof, also, for you will note the recent increase from sixteen to twenty-four pages has been largely taken up by advertisers. There is more than twice the advertising in our columns than a year since.

Why?

Well, business men invest money to make money.

* * *

There's R. W. Pierce Furniture Co., of Los Angeles. They realize that farmers wish something besides plows, cultivators and appliances for outside work, that is, some things for convenience and beauty of the home. California people believe in comfortable homes. The house which realizes that and invites attention to its goods is wise.

WIRE FENCE

The West Coast Wire & Iron Works of San Francisco are issuing illustrated catalogues of the woven wire fence, barb wire fencing, elevator cases railings, and nearly all kinds of wire goods. Any one having use for wire or iron goods will do well to get in touch with the West Coast people and ask for these catalogues. In one little pamphlet entitled "Fence Sense" we note:

"In our fence you get a straight upright and bar wire, not weakened by any crimp, warp or kink, and has not lost any of its life by being twisted before it gets into the fence, thus giving full tensil strength to both upright and bar wire. It is coil spring woven, change of weather does not effect it, and the tighter you stretch it the more the clamp binds and the stronger your fence becomes.

The United States is experimenting in the matter of raising new fruits, vegetables and grains in the Philippines. Beans, asparagus, beets, cabbage, sweet corn, cauliflower, celery, egg-plant, tomatoes, peppers, radishes, rhubarb did well, but pumpkins, cucumbers and melons failed. Cotton promises well. It is also believed that coffee and tobacco can be successfully grown.

C. H. SESSIONS, ASSOCIATE EDITOR

BOGUS BUTTER.

A Washington, D. C., correspondent writes a comment to Country Gentleman of interest as follows:

One of this city's daily papers has recently received an anonymous communication which relates to a subject of considerable interest to your readers. This letter, purporting to be from a "workman," contains the following:

"When the recent attempts of Secretary of the Treasury Shaw, to reduce the surplus accumulations in the United States Treasury are considered in connection with the tax of 10c per pound on oleomargarine, imposed by the present administration, it would seem that the Republican government has done a very unwise thing, to say the least, to tax the workingman's butter on his bread, in order to pile up a surplus that threatens a financial panic. If the tax is not imposed for revenue, the bill is in itself a fraud, for it claims to be a revenue bill, which is the only basis on which it can stand. No other country on the globe taxes oleomargarine or butter, and a necessity for such taxes in a free country is not clear to any thinking mind."

The editor's comment on the above expresses some doubt as to its being the production of a 'workman.' Indeed, suspicion strongly points to the writer as being an agent of the oleomargarine interest, because of the reference to the oleo law as a revenue producing measure. That was the Shibboleth of the oleo fighters in Congress in the attacks on the bill, and it has formed the basis of legal contentions aimed against its administration. The fact is that most laws which seek to correct evils or to achieve general results, through the imposition of taxes, are framed as revenue measures and are so treated in the formal course of their enactment.

This law was enacted, and is now enacted, as far as possible, for the purpose of putting a stop to certain frauds on the pockets of the people. Oleomargarine was sold as butter and at butter prices in enormous quantities. The producers and retailers were reaping an exorbitant, dishonest profit. It was found that the only way to prevent this peculiarly offensive form of fraud was to impose a differential tax on artificial butter, one tax of 10 cents a pound on all such products colored to imitate butter, and an insignificant tax of a fraction of one cent a pound on uncolored oleomargarine. Thus it was sought to permit those who wished the cheap form of artificial butter to secure it at the former cheap rate, while those who wished it colored to resemble butter could buy at a higher rate, but one which was still somewhat lower than the price of genuine butter.

The incentive to defraud the customer, which under previous conditions proved so tempting, was removed. The act was clearly not designed as a producer of revenue, for if all oleomargarine were marketed uncolored, the revenue would be less than sufficient to meet the cost of enforcement. The workingman who demands a cheap butter imitation can obtain it today just as surely as he could before the passage of this law. And if he has compunctions against putting it uncolored on his table, he can cheaply provide himself with a coloring agent. Furthermore, this statute is not a partisan product. At no time did party politics enter into this case. The law was passed, upon the non-partisan demand of the dairymen of the country and to meet the needs of the general buying public regordless of party.

It is learned from an official in the Internal Revenue Bureau that the Commissioner, after a full hearing, having decided that the corporation of which Wm. J. Moxley is the head, did and does use artificial coloring matter in their manufacture of oleomargarine; that the corporation has started suit in the United States circuit court at Chicago to recover $35,000, which it was compelled to pay as a penalty for alleged violation of the law. While this is known as an action in assumpsit and will probably be tried before a jury, there are important law questions in the suit which will be argued before the judge, thus giving the court the opportunity to review the argument made before the department some months ago, that palm oil was the principal ingredient used by the Moxley corporation in coloring the oleomargarine, and that such coloring matter did not constitute artificial coloring.

CALIFORNIA LIVE STOCK BREEDERS' ASSOCIATION.

The California Live Stock Breeders' Association was organized during the State Fair at Sacramento, September 7, 1903, and was effected as a result of two meetings well attended by breeders from many parts of the state unanimous in the sentiment that the need of such an association is imperative in the interests of the live-stock industry.

Secretary Chisholm is sending out invitations to stock breeders to become members, which shall meet with hearty response from all stock farmers. Mr. Chisholm has sent to this office copies of blank applications, list of members and statement of advantages of such an organization. These may be had by applying at the Cultivator office or to the Secretary N. A. Chisholm, Jacinto, Cal.

Every stock breeder in the state get in touch with this movement.

FARMERS ON DAIRY TOPICS.

To get a fine grain the cream should be churned at as low a temperature as is consistent with a complete separation and the churn stopped while the butter is in small granules. Overchurning, overworking, improper methods of salting, working at too high or too low a temperature, are largely responsible for poor-grained butter.—William D. Baker.

I have produced milk for 25 years and have fed nothing that gives so good returns for the money value invested, all things considered, as well-cured, early-cut hay, used in conjunction with the by-products of flour mills, starch and gluten factories and cottonseed meal.—John H. Harmon.

If one is making butter he should raise his own cows, as he has the milk to start the calf on.—Irving J. Gay.

We believe that the best method of improving our dairy herds is to weed our the poor cows by the use of the scales and Babcock test, and breed only the good ones to the best possible sires of the same breed which can be obtained.—E. E. Light, Knox county, Maine.

In this section dairying is the chief industry, farmers having private dairies and delivering the product to customers weekly. This makes a good market for eggs and vegetables.—Alfred R. Smith.

I should feed from 30 to 40 pounds of silage, 5 to 8 pounds of hay mentioned, and 4 pounds of cottonseed meal and shorts, equal parts, at two feeds.—R. W. Ellis, American Cultivator.

Hand Separators

There are still many farmers who for some reason or other, are unwilling to invest in a cream separator, apparently preferring the old way of handling their dairy products to the more modern methods now in use, says the Editor of Farmers' Tribune. The old way of setting milk and skimming by hand leaves at least .5 of one per cent of the butter fat in the milk; this is practically a total loss, because butter fat is not worth anything like 20 cents per pound for hogs or calf feed. From a cow that produces, say 250 pounds of butter per year, or its equivalent in butter fat, which would be about 300 pounds per year, we would lose, by the old method of skimming, about 37 pounds of butter fat annually. This 37 pounds of butter fat at 20 cents per pound, would amount to $7.40 per year. A farmer milking fifteen cows would, therefore, lose about $101.00 worth of butter fat every year. If he milks 20 cows, there would be a loss of $148.00 a year, or enough to buy a hand separator and still have a handsome profit left at the end of the first season.

It is generally considered that it pays to own a separator for a herd of ten average cows. The figures we have based our calculation on apply to cows about the average in butter producing qualities.

During the last twenty years, however, the manufacture of cream separators has grown to enormous proportions, which is perhaps, more conclusive evidence of the merits of these machines than any figures of profits or losses would likely prove to be to those farmers who are slow to take hold of modern methods of handling their products.

The farmer is very conservative, and it is generally necessary for him to see some one take the lead in the neighborhood before he is ready to take hold of any new departure from his old established way of doing his work. More of our farmers ought to read agricultural periodicals and keep up with the progress of the times. Why should not every farmer take two or three papers to inform himself on his particular line of work? There are especial dairy papers, special horse papers, special agricultural journals, particularly adapted to his own local conditions, that he should constantly read and keep in touch with. The farmer needs special information, just as well as the lawyer or doctor or other specialists do.

There are a number of advantages that accrue to the farmer from the use of separators. First, if he sells his milk to the creamery, it costs less to haul the cream than it does to haul the whole milk. Second, if he skims in the old way and makes butter on the farm, he not only loses a large amount of butter fat per year as indicated above, but most of the time he has only sour milk as a by-product, whereas if he separates the cream, he has good sweet skim milk, a most excellent food for his calves and other farm stock. Third, butter of better quality can be made from separator cream than from cream raised in the old way, for the reason that it can be ripened more uniformly. Fourth, the labor of caring for the milk is an item of no small importance for the farmer's wife. With the separator, this is greatly reduced and the drudgery of the good wife thereby largely decreased.

In regard to the kind of a separator to buy, it may be said that all of the leading machines are good. They all skim so close that there is only a trace of fat left. The main points to be looked after is to see that the machine is well made in a workmanlike manner and that it is simple, easy to operate and to clean.

The thing for the farmer to do is to write to the different advertisers and notice what each company has to say about their machines, and then decide for himself on the particular make to purchase.

Each make, of course, claims advantages over other machines. Some claim that their machines can be more easily cleaned than other makes, and again others claim that the milk can be poured into the vats or can with less labor, and still others that their machines have fewer parts, and therefore less to get out of order.

With the aid of such well illustrated catalogues as are issued today, however, any intelligent farmer can weigh those points at his leisure and readily come to a conclusion satisfactory to himself, just as he does when purchasing a self-binder or any other important farm machine.

DAIRYMEN OF CALIFORNIA.

The California Promotion Committee and the California Creamery Operators' Association are planning for a representative exhibit of dairy products at the World's Fair and also expect to capture for California the National Buttermakers' Association Convention—to be attended by from 6000 to 10,000 delegates—in 1905. In order to secure this convention there should be a good exhibit at St. Louis and a strong representation of California dairymen during the convention of the Buttermakers which meets on the Exposition grounds in October, 1904, and which will then determine where the convention will be he'd in the succeeding year. California wants this convention. The importance of her dairy interests—dairy products in this State amounting to more than $18,000,000 annually—demand a wide recognition. The Buttermakers' convention, if held in California, will be the largest and most important agricultural convention ever held west of the Rockies. It will be valuable to our own dairymen in placing them in closer touch with the East, and the buttermakers of the East will learn of the great and increasing importance of dairying in California. This committee desires the co-operation of all dairymen in the State. It is hoped that a strong representation of California dairymen may be made in St. Louis and that the dairymen of California may meet the delegates to the National Buttermakers' Association at the St. Louis convention and impress upon them the desirability of California for 1905. If the number of those desiring to go to St. Louis is sufficient it will be profitable to engage a special train to take the California dairymen to the Exhibition City, so that a campaign may be the more successfully waged for the convention. All those who are interested are requested to at once communicate with Chas. H. Saylor, Secretary of the California Creamery Operators' Association, 114 Drumm St., San Francisco.

POTATOES TOO HIGH. BEANS NOT DESIRABLE.

Editor Cultivator: Will you kindly through the Cultivator answer the following questions: Will it pay to feed raw potatoes to growing or fattening hogs? Are beans in a raw state a profitable food for hogs? Is it advisable to carry March pigs over the winter? As the best breeds can be made to weigh 300 lbs. in nine months, is not that the better policy? Answers to these questions will much oblige.—H. D.

I think the price of potatoes too high to make them a profitable feed for hogs. Hogs do not seem to take readily to raw beans. Once I tried to feed them, but they would only eat them when cooked and then ate them sparingly. The highest price is usually paid for hogs weighing under 300 lbs., and if the required weight can be obtained in nine months I would not think of keeping them 12 to 15 months. It is claimed it costs more to produce the third hundred pounds than the second. Chicago prices are in favor of light weight.—C. H. Sessions.

DAIRY DON'TS.

Don't turn the cows out in the cold autumn rains and storms.

Don't scrimp the feed when the cows leave the pasture.

Don't curry and brush the cows with the milking stool.

Don't keep a cow that is not earning her feed.

Don't breed to a scrub sire.

Don't milk with wet hands.

Don't allow the milk to stand in the stable.

Don't mix water with milk to raise the cream.

Don't guess the temperature of the cream by sticking the finger in it. (A thermometer costs 25 cents.)

Don't salt butter by guess; weigh or measure it.

Don't use cheap, coarse salt, only fine dairy salt is fit.

Don't touch the butter with the hands.

Don't think rinsing will keep cans and dairy utensils clean; add boiling water, washing powder, muscle and sunshine.—L. W. Lighty, in National Stockman.

STARTING A BALKY HORSE.

For the benefit of those who have been caused a great deal of anxiety by a balky horse, lost trains as well as tempers, and even sometimes ruined the horse, says a correspondent in the Horseshoers' Journal, I will give your readers a remedy which no matter how bad he is, will start such a horse 99 times out of 100. Of course it may fail one time in a hundred. When a horse balks, no matter how badly he sulks or how ugly he is, do not beat him; don't throw sand in his ears; don't use rope on his forelegs or even burn straw under him. Quietly go and pat him on the head a moment; take a hammer or even pick up a stone in the street; tell the driver to sit still, take the lines, hold them quietly, while you lift up either front foot; give each nail a light tap and a good smart tap on the frog; drop the foot quickly and then chirp to him to go. In 99 cases out of 100 the horse will go right on about his business, but the driver must keep his lines taut and not pull or jerk him back. If I have tried this once I have tried it 500 times, and every time I have suggested it people have laughed and even bet $5 and bottles of wine that I could not do it. So far I have won every bet. This may make you smile, but a horse has more common sense than most people are willing to give him credit for. The secret of this little trick is simply diversion. I am a firm believer that with kindness and proper treatment a horse can be driven with a string.

The Continental Creamery Company of Topeka, Kansas, will enter the creamery business of California. This is the decision that its representative, Mr. A. Jensen, has arrived at after having spent some time in Humboldt county looking over the field.

If carried out, the plans are to build the best creamery plant in the United States at Ferndale with a capacity of 30,000 pounds of butter daily, equipped with every facility for making butter and storing it.—Produce Review.

The calf should have the milk in small portions, and as often as the cows are milked, as only then we get the full benefit of the milk.

The Churn

The Indiana Experiment Station in Bulletin No. 96 discusses in a practical way the kind, care, operation, temperature, etc., of churns. It says:

The kind of churn which has no inside fixture, but dashes the cream from one side or end to the other by the motion of the churn, has proved most satisfactory.

The paddles, dashers, etc., of whatever pattern, are apt to hurt more or less the texture of the butter, and also cause a loss of butter in the cream, which adheres to them and to the corners of the churn, especially when the cream is a little thick.

When the churning is done in such a short time as is claimed by admirers of many so-called improved churns, it is usually at a sacrifice of butter-fat left in the buttermilk, even though it may not be apparent to the eye.

Wooden churns are to be preferred to metal; because of their getting loose in dry weather if not used frequently or properly taken care of, a steel barrel-churn, tinned inside and painted outside, has been put on the market. The objections to it are that the cream warms up more easily when the room is warm, and more butter will adhere to it than to the wood. Care must be exercised to wipe it dry or it will rust. On the other hand, the cream might be kept in it until enough is secured for a churning, making one less vessel to care for.

The size of the churn should be such that it will never be filled over half full, and better if only one-third full. Where the ordinary churning amounts to from two to five gallons of cream, a fifteen-gallon churn is a desirable size.

The speed of a barrel or box churn which revolves should be sufficient to carry the cream to the highest point, allowing it to fall the length of the churn. If it is turned too fast, the cream will remain in the ends; if too slow, it will slip around and churn slowly. The agitation which results from concussion is more desirable than that from friction.

The time required for churning depends on the ripeness of the cream, the temperature, the fullnes of the churn, and amount of agitation and the richness of the cream, and to a lesser extent to a period of lactation and feed. Quick churning usually means large loss of butter in the buttermilk. Under ordinary conditions from twenty to forty minutes is a reasonable length of time for churning, and no objection to an hour if firm butter and thorough work are desired, especially if the churning is done with other than hand-power.

The only rule in regard to temperature which can be given is to "churn at as low a temperature as possible, and have the butter come in a reasonable time." A high temperature makes quick churning, large loss of butter in the buttermilk and soft butter; a low temperature requires a longer time, makes a firmer butter and reduces the loss in the buttermilk. While most cream can be satisfactorily churned in from twenty to forty minutes at some temperature between fifty and sixty degrees Fahrenheit, some unusual condition may require a little higher temperature or longer time. In the experiment station dairy from fifty-four degrees to fifty-six degrees is the usual churning temperatures. When gluten meal or feed is fed, the churning temperature may be lowered from two to four degrees, while if much cotten-seed meal is fed, it may be raised a little if the butter is slow in coming.

The variations in the churnability of cream from different cows and herds, from the same cows at different seasons of the year, and varying stages of lactation, require some variation in the churning temperature. Use a thermometer; then if the butter comes quick and soft, lower the temperature of the cream next time. It is very desirable that the cream be held at the churning temperature for at least two hours previous to churning.

MILK FEVER IN COWS

Professor J. C. Robert, Mississippi: Parturient paralysis, parturient apoplexy or "milk fever" is the name applied to the disease peculiar to cows seen at or about the time of calving. The disease is one especially to be dreaded, because it occurs only in deep milkers at the prime of life, and has usually resulted in death. The name "milk fever" is misleading, since there is no fever when the disease is uncomplicated, but frequently a subnormal temperature.

Cause.—The pathology of this disease is not well understood. Many theories concerning its production have been advanced, the latest and most rational of which is that given by a Danish veterinarian, J. Schmidt, which is as follows: That the disease is due to a poison generated in the udder and absorbed by the system. The sudden increased flow of milk incident to birth of the calf results in casting into the milk channels great quantities of glanular cells. These decompose, form poisons, are absorbed into the circulation, permeate the tissues and produce auto-intoxication. The tonic effect of this poison is especially manifested by the nervous system, resulting in paralysis, hence the name parturient (at the time of birth) paralysis.

Symptoms—These usually occur from a few hours to three or four days after birth of the calf (in rare cases a few weeks after calving), and, as a rule follow an easy and rapid delivery. The symptoms are mainly those of nervous disturbance. At the onset of the disease the cow becomes excited, she moves around the lot or pasture as if in pain; may lie down and then get up immediately, turn head to side, and kick at flanks; groans, and grinds her teath. Later, she loses control of her muscular power as seen in dragging the hind legs, staggers, lies down and rises with great difficulty, finally becomes so paralyzed that she cannot rise at all. When down she usually rests upon her chest with head turned to the side of flank, but she may stretch her head out straight.

The bowels and urinary bladder are more or less paralyzed, resulting in a torpid condition of intestine and retention of urine. Later, loss of reflex motion occurs, so that the eyeball may be touched with the finger and she may not close the lid. The pharynx and gullet are unable to take food to the stomach, so that an effort to drench the cow is apt to result in death by the liquid entering the lungs and producing broncho-pneumonia from irritation of the bronchial tubes, or possibly producing immediate suffocation and death. As the stomach and intestines are paralyzed, the food may ferment and cause the animal to become bloated. The pulse is rapid and weak (60 to 120 per minute), respiration labored, and temperature about normal (100.5 to 102 degrees Fahrenheit). In some cases the temperature is subnormal.

Treatment—Preventive: Since parturient apoplexy is common only in deep milkers at time of calving, preventive measures consist in diminishing the activity of the udder at that time. This is best accomplished by reducing feed, providing exercise and keeping the bowels open. Milking before calving is also probably beneficial. When a cow is attacked by this disease drugs are not likely to be of any use. "Schmidt's treatment" is the most successful, and consists in thoroughly cleaning the udder with soap and water, and infuse into each teat a solution of iodide of potash. The object of this is to neutralize the poisons. The dose is from two to three drams of iodide of potash dissolved in a quart of boiled or distilled water. The orifices of the teats should be first cleansed with some strong antiseptic. For introducing the iodide solution some apparatus equivalent to a common fountain syringe is necessary. If necessary this treatment may be renewed after eight or ten hours. But, while the treatment is simple enough, a veterinary surgeon should be called whenever symptoms of the disease are plainly manifest.

Next year the National Buttermakers' convention will be held in St. Louis. Heretofore 5000 to 6000 delegates have attended. The California Promotion Committee has in view the running of a special California train carrying butter makers to that convention, who will be expected to secure the National Convention to be held in this state in 1905.

The telephone is becoming an important factor in the business life of the farmer. It is generally going in on the farms of eastern progressive agriculturalists, and is both economical and convenient.

SUCCESS IN THE SHOW ROOM.

As a general proposition a true chicken fancier is born, not educated. He or she should so love the work of caring for chickens and preparing them for exhibition that the work incidental thereto will seem rather recreation than toil. The usual method pursued by fanciers in preparing their birds for exhibition is to separate in the fall, say October, the cockrels from the pullets, placing each in clean, warm yards, where no direct sunshine is felt. Care must be taken not to crowd the cockrels or pullets as to do so impairs their powers of growth and development. About two months before show time the fancier should go over his birds with a view of selecting the best ones for exhibition. Weigh each bird, place in a separate coop and attach a card with the weight, so as to keep a record of the gain of each fowl. Feed should be given in different quantities as the time for exhibition approaches. Hard boiled eggs, a tablespoonful of sugar to each fowl, once a day, will add weight to each bird, but should not be used as a diet more than five or six weeks. Among the last things to be done, say, ten days or two weeks before show day, go over the birds carefully, noticing that no feathers are broken; if there are they should be pullel out. From this time until exhibition handle the birds daily, groom them thoroughly, wipe with a cloth and stroke with the hand until the birds manifest a liking for the treatment, which they will do after a time. When the birds become familiar with this treatment, that is, so tame as to permit handling, select the specimens of cocks and pullets desired to bring highest awards and begin the practice of posing. It will surprise one how readily cockrels will adapt themselves to position. When once they learn to pose in the presence of one or more persons they will take that attitude when confronted by a number and remain proud and dignified for some minutes at a time.

Do not abuse the birds in training them. Do not handle them roughly, else they will become timid and never learn the art of posing. Stroke gently with one hand under the throat while you rub the legs and body gently. If the bird you are training shows impatience take it in your hands, stand it on your knee for a few moments, talking in a low voice the meantime to secure the confidence of the bird. Don't under any circumstances lose your temper when training. If you do you will fail of any results. Kindness is as much a necessity in dealing with fowls as with stock, and the finer bred the bird the more sensitive it is and the greater care must be exercised in handling it. Two week's training as to position, will be enough if daily practice has been given two or three times each day. At the last, rub carefully with a soft cloth to brighten the feathers and attend strictly to feeding and watering and sanitary conditions.

Be sure to follow these suggestions as to training:

Keep the coops clean.

Feed and water regularly.

Handle carefully.

Always assume the same position when training.

Always use the same tone of voice.

Never grow angry.

Train often, but not too long at a time.

THE GREAT SAN FRANCISCO SHOW.

Preparations are being made toward holding in San Francisco the first week in December the greatest poultry and pet stock exhibition ever attempted in the West. The various poultry associations of the state are combining to make the poultry display the grandest of anything ever seen on the coast. This department is under the management of the Oakland Poultry Association, and premium lists may be had by writing the secretary, J. C. Williams, 33 Market street, San Francisco. Already entries have been received from all sections of the West, as well as from Eastern breeders, and it is predicted that there will be a battle royal.

This exhibition will be held in the Mechanics' Pavilion, situated in the very heart of the city of San Francisco, the finest auditorium on the Coast for the purpose. It is expected that there will be no less than 2000 entries in the poultry department, 1000 pigeons, and hundreds of dogs and cats; in fact by all the various clubs and associations combining this will be a gigantic exhibition. It will be a rare opportunity for breeders to exhibit their poultry, as well as for fanciers interested in the other departments to exhibit and visit the show.

ANSWERS TO QUESTIONS.

My husband and I are much interested in your Cultivator articles, and would like your advice. Others situated in similar surroundings might also profit, so please answer in the paper.

We have a cosy home in the city. The back of the lot is utilized for chickens, of which we have about ninety-five kept in six flocks. Their pens are cleaned daily for three reasons. First, we do not wish to be a nuisance to the community. Second, we have some regard for our own pleasure. Third, we intend the fowls shall keep healthy. Now, with this limited space, do you think we would be wise to sell a part of the hens and stock one yard with Indian Runner ducks? Our hens give a profit of about one dollar each for every year, but we do not now have pure-breds.—Mrs. W. W., Los Angeles.

It is very difficult to advise any one. For my part I should keep only chickens, try to improve the breed, and make my hens pay a larger profit. This you can do by having hens that will lay more eggs. My reason for advising against Indian Runner or any kind of ducks to be kept in a small back yard is that they require more care in keeping the premises clean than chickens, they spill the food more and foul the water, also they easily frighten at night. Otherwise the Indian Runners lay an immense number of eggs. In fact you can count on two dozen eggs apiece every month from now to July or August, they are never sick, never have roup or lice, or mites, after they get feathers, for the feathers are too oily and grow too closely together to permit the lice to live. The Indian Runners are very easy to raise, eat much less than Pekings and are a delicious table fowl. Their eggs taste like hen's eggs, they are not coarse like other duck eggs.

* * *

Editor Cultivator:—Will you kindly have the madam who gave us that good lecture on poultry inform us through your valuable journal the cause of Indian Runner ducks laying small eggs without yolks, and prevention if there is any. My stock came from Miss ——, who got hers direct from the White Plume ranch, therefore should be of the best. I would also like to know what the importer of the Indian Runners thinks of the following for a good balanced ration for the ducks. A 5-lb lard pail of wheat bran, same of rolled barley, same of corn meal, same of fine cut green alfalfa, 2 handsful fine ground bone and one handful of meat meal. And sometimes a small quantity of Egyptian corn. If any improvement can be made on the above ration to get best results, would be thankful for the information. Will the ducks lay as well when a flock of twenty or thirty are allowed to run together with several drakes, or should they be kept in smaller numbers and on different ranges.—W. S. M., Upland.

I have never known of Indian ducks laying eggs without yolks, except once, the first egg laid by a young duck. If they continue to do so, give them more green alfalfa and a little cracked corn as an extra feed at noon. The ration you mention could not be improved upon, be sure however to add five per cent of coarse sand to it. Have not more than four drakes with twenty or thirty Indian Runner ducks. Thirty is not too large a flock.

* * *

Editor Cultivator—Please answer the following questions in the Cultivator. Is raw or cooked barley good for laying hens? Is it good to fatten briolers? Are tomatoes good for laying hens? Is shake houses good for hens as whole boards, provided cost is the same? A reader of your paper. H. C. B.

Rolled barley is good for hens, it is good either cooked or raw, if cooked be sure you do not let it get sour. Barley meal or ground barley mixed with bran and corn meal is very good for fattening broilers. Tomatoes will not hurt laying hens if given once a day. Whole boards are better than shakes because they will not crack and split so easily, but whole boards must be tongue and grooved or else carefully battened to be sure there are not cracks and draughts.

anced feeds. As I have explained before a balanced feed is one in which either the elements of eggs, or feathers, bone, muscle, or flesh are contained. Now in California, or at any rate in this part, during certain seasons of the year there is a great lack of certain elements principally green food and animal or insect food. To make a success in poultry keeping these missing elements must be supplied, and this is what the Midland Feed Co. and Coulson propose to do, and I am glad to say they succeed. I have tried them both and can recommend them both. For some places the Midland food would suit better than Coulsons, for other places Coulsons would do fully as well. When I used them, the first effect was a sudden lowering of the egg yield; the hens did not like the change and would not eat either food until I had to starve them to it. When they got accustomed to it they ate it, but they did not seem to relish it for two months. Then the difference was seen, the moult came on and the Midland fed hens made a quicker moult than Coulsons, but the Coulsons laid better during the moult. I usually feed liberally of green cut bone, but I found I could not give even one spoonful to ten hens fed with the Midland without bringing on bowel trouble, showing that the Midland contained as much protein as the hens could possibly digest. With Coulsons I could, and did, feed green cut bone during the moult, showing that there is not quite so much protein in Coulsons; and that I could feed more liberally of it without danger of upsetting the digestive organs. Both Coulsons and the Midland are exceedingly valuable well balanced rations, and you will have to judge for yourself which suits your breed of fowls best and which suits your pocket best. With either food I would feed every day and liberally during the moult and every other day or about three times a week during the rest of the year. My reasons for this is that I think feeding those every day would keep the hens in a constant state of moulting. But only an experiment would prove this, it depends very much upon what the fowls pick up during the day and also the breed of fowl, the Mediterranean fowls require a narrower ration, that is more protein and can stand it better than almost all other breeds.

* * *

More About Roup.—Dear Madam, I have been very much interested in your talks on poultry and have got a good many pointers from them. I have had poultry to care for for about five years, but have never had any real trouble till a year ago. I over-crowded my young chickens and had roup. I had more success with camphorated oil than anything else, but there was one pullet about four months old that I gave up, so I concluded a little experimenting would not make any difference. When I was a child I was subject to sore throat, but I never had diphtheria. They used to blow dry sulphur down my throat, so I caught the little pullet, held her bill open and dropped a little sulphur on the patches that lined her throat. When I caught her she was so far gone that she gasped for breath. That was all I gave her, and in three days she was as well as ever, and is now one of my best layers. A few days ago I discovered one of my Black Minorca cockrels, aged seven months, having a hard time to get his breath, I caught him, gave him a dose of castor oil, and broke a piece of sulphur into his throat, put him into a coop by himself. Today he eats as well as he ever did and has no trouble to breathe. I hope you will try it if ever you have a case of roup or diphtheria again. Yours truly.—Mrs. Adelia A.

I am very glad to print this letter from Mrs. A., as it may be quite a useful suggestion to many. The very clever surgeon who gave me many a hint about doctoring poultry, said he used the following for human beings, and had found it equally efficacious with sore throats in poultry. One ounce sulphur, one ounce powdered alum and one ounce magnesia, mix and blow into the throat—will usually cure in one night. One thing you may remember, that the same medicines that are used successfully in the human family are as successful with fowls. The very best doctors will tell you this and I have proved it to my own satisfaction many times, but of course those who have patent poultry medicines for sale will assure you that fowls require entirely different remedies. Last year a banker in Los Angeles asked me what to do for his chickens, they seemed to have colds. "Have you any quinine?" I asked, he looked surprised but said "Yes." "Well, give them each a capsule of quinine night and morning for a few days, and a little red pepper in their food." Next week being in the bank again I inquired after the chickens. He smiled, "they are all well, but oh! you should have heard what fun my family made of me for giving the chickens quinine, but it cured them." Probably if I had said get Elsinore poultry tonic, or Sheridan's poultry cure, or some one else's panacea he would have forgotten, or neglected it and all his chickens would have died, but quinine was in the house and handy and he saved his fowls. I often give a liver pill, Carter's Little Liver Pills, besides quinine, asafoetida, sulphur and red pepper. Quick and decided action is the prime requisite. Blue stone in the water, a piece the size of a bean, is the best cure and preventative.

* * *

POULTRY SHOWS.

Next month the poultry shows in California commence and I would like to say a word about them. Poultry shows are the greatest educators for poultry breeders of every kind; seeing is believing, you will see why the winners win, you will understand more about the poultry business by visiting one good show than by all the reading you can do. Poultry shows are a great advertisement. Those that have good birds are sure to take plenty of orders, and many sales are made at the shows. Even if you have only a few birds you may have winners. A gentleman at Sacramento, Mr. Richardson, bought one setting of eggs last year of me, he raised nine, sent them to the Sacramento show and took two first prizes with them in hot competition, now if he had thought it is not worth while to show as I have so few birds, he would not have won. Another gentleman had one White Rock cockrel, put him under his arm took him to the show and won first at Los Angeles several years ago, so if you have only a few, show them, they may prove winners.

There are a great many premiums already promised not only for first prize winners, but for those even down in the sixth class, so come one and all show whatever you have and win something and learn something. The White Plymouth Rock Club gives three fine ribbons for members of the club exhibiting at San Francisco, at Los Angeles and at San Diego. Also a beautiful silver cup at San Francisco.

The dates of the shows are, San Francisco, December 1-5; Secretary J. C. Williams, 33 Market St., San Francisco.

The Los Angeles Show, Dec. 8-12. Secretary, H. W. Kruckeberg, 123 S. Los Angeles Street. The San Diego show, Jan. 6-19, Secretary, Harry McIntire, San Diego.

MOLTING HENS.

As it takes about 100 days for the hens to get a complete new coat of feathers, and that time is usually not completed until December, look out for their comfort all through the wet days of Fall, the cool evenings, the frosty mornings. They sit around and shiver at these times with much less covering than you think. You have been in the habit on the hot nights of leaving the coop doors open, and so many people keep up the habit until the first snow drives in. By this time, through your neglect, the thinly clad chickens, both hens and cockerels, may have taken cold, and a chicken once badly afflicted with cold is always a chicken to which something is happening in the way of disease. One bad cold always seems to stay close by the chicken's throat ready to break out again. So shut up the coop and poultry house doors very early in the chilly evenings, and keep them shut until the morning's worst chill is over, and provide warm places where the chickens may shelter on the rainy Fall days. Lack of care in this way, during molting time, loses one many a good-priced lot of chickens, besides weakening those left.

Young chickens will sometimes molt twice during the first 12 months of their lives and often show different markings in the second coat, and while the differenee may not be great, yet, in a standard-bred fowl, may disqualify it from the show pen. Sometimes the first feathers show the markings from a past ancestry, and these markings, if slight, may disappear completely in the second coat of feathers.

Turkey hens sometimes molt late, and their bodies will be almost naked in the cold days of Fall. Give her a warm shed and feed her all she wants to eat of good corn and other foods as nutritious. The idea of turning the chickens and turkeys off to look for their own rations at the very time this drain comes on the system!

Do not neglect your poultry yard and then expect satisfactory results from your chickens. Attend to the cleanliness of your fowls and their dirt and they will line your pockets with gold coins.

There is no business where clean money can be made faster than on a well conducted chicken ranch.

ROUP and CHOLERA

First know what is wrong with your fowls before giving medicine. Some would tell you that there is no cholera in this country. Try a package of Palmer's Cholera Remedy in all cases except Diphtheratic Roup, and you will find it effective.

MIDLAND POULTRY FEED

Will make your fowls moult in one-half the time, which means they will lay that much sooner. "Laying fowls are paying fowls." You wlll not be disappointed at the results you get from feeding Midland Feed.

No. 4, Egg and Feather Producing Food

Is what you should feed your hens now, and the results you get will surprise you, for we know it will prove a paying investment. Our book, "The Science of Poultry Feeding," will tell you more about this feed. Send for it. It is FREE. Also

No. 1, Nursery Chick Food
No. 2, Growing Chick Food

We will be pleased to give you further information about this feed if you wish it. WRITE FOR PRICES.

The Only Reliable Balanced Ration for Poultry in the World.

These special foods are composed of the very best materials obtainable and as carefully and accurately mixed as it is possible to make them. They are a COMPLETE FOOD and will produce specific results, each for its purpose, and no other. We want you to become an established customer of ours. We want your trade, be it little or much. There is only one way we can secure it and that is by sending you material that will do what we claim for it.

The Midland Feed will cost you very little more than any good grain you now feed, and no more than you now expend for all the extras you must use in addition to your grain, and the results will be so far in excess of any previous experience you have had that you will readily acknowledge its value. What the poultry man must be able to count on to a certainty is RESULTS.

Thousands of Shade, Ornamental and Fruit Trees

Besides That, Lots of Roses, Climbing Vines, Palms, Etc., as Well as Deciduous Fruit Trees

There is always something attractive, even to a person unacquainted with botany, in a visit to houses where ornamental plants are grown. The nurserymen will insist on tacking on a list of names which makes the nursery catalogues most uninteresting to a person not conversant with these names. But a glass or lath house filled with flowering and foliage plants and palms certainly has an attractiveness which but few of us can resist, when opportunity comes to visit such a place.

SYCAMORE GROVE NURSERIES.

One of the most attractive houses of this kind which we have visited recently, belongs to J. J. E. Saint, proprietor of the Sycamore Grove Nurseries. These nurseries are situated in the Arroyo Seco, through which runs the main road from Los Angeles to Pasadena. The great sycamore trees in the background with the abrupt hillsides of the arroyo still further back, give a romantic setting to the beautiful plants before us.

IN THE GLASS HOUSE.

The yards are filled with large potted palms and thousands of shade trees, such as acacia melanoxylon or more familiarly known as the black acacia or, as called in Australia, Blackwood; also Sterculia diversifolia; the camphor tree; and as well, many varieties of the eucalyptus. The most attractive of these is probably the E. ficifolia or "Scarlet-flowering Gum." It may be in order to add that the good old-fashioned pepper tree is also in stock. This latter tree was once the favorite in Southern California, It afterwards seemed to have fallen into disfavor, but this year's demand for it is increasing so that possibly it may have a larger planting than for several years.

The E. globulous or "Blue Gum" which sometimes reaches the remarkable height of 350 feet, is the favorite in this state—that is, judged by numbers—of this Australian family. Of these Mr. Saint has thousands in boxes and many others in pots and cans. E. citridora or "Lemon-Scented Gum," is largely planted for a timber tree; also for garden ornamenting. The rostrata or "Red Gum" is much hardier than the "Blue Gum" and nearly as rapid in growth and much better for many purposes.

The acacias are perhaps worthy of more extended notice. For besides the Melanoxylon with its drouth resisting ability, its rapid growth, symmetrical pyrimidal head and necessity for almost no pruning which some say makes it the most suitable of all trees for street planting, there are other beautiful varieties of this most wonderful tree, also an Australian. One of them is a shrub or dense bush with bluish foliage and yellow blossoms. It is Acacia cultiformis and desirable for lawn planting. Acacia Malissima is beautiful for either garden or lawn. It has a feathery, fine foliage, its top a mass, at times, of magnificent yellow flowers. But as to flowers for decorating and a tree much used by florists to supply trade with flowers, the peer of all is the Acacia floribunda. It is not a large tree, but its beauty wins it many friends. The "Golden Wattle" or acacia pycnantha, is the largest leaved of all the acacias and an attractive tree, though it requires much pruning.

These trees, with Auricaria Grevillya, Umbrella, Japonicas, and numberless others, are the principal features of Mr. Saint's large nurseries. While he handles nearly everything that grows out of doors, yet in the matter of shade trees is where he specializes and shows his greatest success. Vast numbers are sold in comparatively small lots, but the wholesale business is also a large factor in the success of these nurseries These he has in all sizes from little plants in pots and boxes to trees from six to eight feet high in tubs and large pots. Any one wishing to give a new lawn or yard the appearance of having been occupied for some time, may secure these large trees of the Sycamore Grove Nurseries and accomplish that end very quickly.

With these shade trees are exhibited vast numbers of Phoenix canariensis or the ornamental date palm of the Canary Islands. This is one of the most popular palms in California and is most extensively planted in lawns and gardens.

It is more slender and graceful than the date palm of commerce which accounts for its more liberal planting. Notwithstanding this is the favorite, the common date palm which sometimes reaches the height of one hundred feet, is kept in stock. When it reaches greater age it is then much more ornamental than it is while young.

Inside the glass and lath houses are the less hardy plants, and especially ferns and tropical palms and hanging baskets. As may be seen by one of the cuts on this page, there is one house devoted almost entirely to hanging baskets and different varieties of ferns. Of course, one which predominates is the "Boston Fern," or technically Nephrolepis exaltata Bostoniensis. The wide fronds and graceful habit of this fern has made it the most popular and one of the best sellers the nurserymen have. It is used both in pots and baskets. The common hanging baskets are in stock in all sizes and of the more common Asparagus sprengeri to those made up of more rare plants a number of them are most beautifully arranged. Besides that, Mr. Saint takes orders to produce baskets of any size of plants which may be desired. In climbers and vines there are Jasmines, Bignonia Tacoma and Bougainvillea.

Back of the glass and lath houses containing the ornamentals, is the potting shed where busy hands take the little plants from the seed-beds and arrange them in the small pots, also where they are taken from the small pots and placed in the large ones.

FERNS AND HANGING BASKETS.

Near it the roses, climbers and bush, all colors and kinds—that is of the accepted best varieties for California.

The stock of deciduous fruit trees and grape vines while not a specialty, so much as the evergreen or ornamentals, yet in this Mr. Saint has a stock which will supply the planter with any varieties wished.

THE POTTING SHED WITH THOUSANDS OF POTTED SHADE TREES.

Mr. Saint is issuing a catalogue of the stock, also a wholesale list. These will give much more information than can be given in an article like this. They may be had by addressing Mr Saint at Pasadena street, Los Angeles.

Thrifty Strawberry Plants.

Acres of berries. Arizona Everbearing, Brandywine, Excelsior and other varieties of strawberries. That's not uncommon. But the uncommon feature of it is the uncommon thrifty appearance of the plants. Great dark leaves, and so large and strong growing as to attract instant attention.

Where? At Covina. Frank P. Baldosser's place. Other sections may be as favorable to strawberries. Other men may be as successful. But surely none can show better results than Mr. Baldosser does.

The photos on the first page of this issue give a faint idea of the beautiful appearance of these plants and the thorough tilth of the soil. The views were taken by the Cultivator photographer during an irrigation of one of the sections. The place, fifteen acres, is divided into three sections for purposes of irrigation, and on the lowest corner is a large alfalfa field on which all waste water is allowed to flow. From this it may be seen that there is no waste whatever on the water supply.

The water for the ranch is abundant and handy. It is on the corner of the place, in a pipe line, and Mr. Baldosser has extra water rights, which makes it possible for him to put in his gate and secure a head at a moment's notice.

After the irrigation the ground is thoroughly cultivated, the suckers pulled and all weeds carefully destroyed wherever they may have secured a foothold.

The plants are fourteen inches apart in the row and the rows are twenty-eight inches apart. This gives some thirteen or fourteen thousand plants to the acre.

As noted, the principal berry planted by Mr. Baldosser is the Arizona Everbearing. Of this variety he has over 100,000, or had some weeks ago. The early sales are already being made, so this large number may be already somewhat reduced.

The plants from which these came were all originally from the East, are all true to name and bear magnificent fruit. They are true to the name in this, that they are everbearing. Of course they have their seasons, yet the remarkable persistance of bearing is attractive from a financial standpoint.

One section of this place was planted last February and up to this time have paid for themselves, all labor on them and the water. That gives an idea of the worth of these plants and the manner of handling.

"O, well but he puts lots of expensive work and water on them. Sure he did. And every one else can do the same and succeed as Mr. Baldosser does. Work, intelligent work is necessary to success in berry growing as in other lines. But it brings its reward.

Mr. Baldosser offers plants for setting from this field. Berry planters will enjoy looking at them.

The grape fruit growers in Ventura are cutting out their trees because they say it does not pay to raise the fruit.

Unless all signs fail, Southern California will this year market the largest and best crop of citrus fruits in its history. It is too early in the season to forecast for a certainty what the extent of the crop will be. Present conditions, however, warrant the prediction that the crop will be from 25 to 50 per cent larger than it was last year, when 22,390 carloads were sent to market.

BY ERNEST BRAUNTON, GLENDALE, CAL.

IMPROVEMENT ASSOCIATIONS.

This department has many times been asked regarding literature concerning the formation and work of improvement asociations and would refer all interested persons to the secretary of the "National League of Improvement Associations," Springfield, Ohio. "The object of this organization is to bring into communication for acquaintance and mutual helpfulness all organizations interested in the promotion of out door art, public beauty, town, village and neighborhood improvement." This league issues bulletins and circulars concerning all lines of work noted in the above quoted clause, which tell in detail just how to organize and carry the work to a successful finish. Through them you can get in touch with the methods of every like association in the state or even in the United States.

* * *

ROSE CLASSES.

J. M. C., Redlands, asks: "What is the distinction between the classes of roses known as Hybrid Perpetuals and Teas?"

We pass, and in self defense ask: "How old is Ann?" The mixture of these two and many other classes has become so intricate as to render separation or classification well-nigh impossible. Crosses between these two were numerous many years ago and some of the offspring have been crossed back on one of the original parents or with a rose of some other class and the result by a Tea or Hybrid Perpetual until it is impossible to trace the parentage. Roses have been so mixed that the tea scent is a characteristic of many classes and it is hard to say just what are pure Teas. In our next issue we will endeavor to give the leading "earmarks" of the principal classes and the names of the most common roses in each class.

* * *

MAY THE WORM TURN.

The orange maggot was spoken of in the Cultivator last week in connection with Mr. Disbrow's trip to Mexico. This worm takes its name from the state of Morlos, south of the City of Mexico, from which the oranges come which are infected with the maggot.

Regarding the spelling "morales" which we gave, Mr. Braunton kindly corrects us as follows:

Editor Cultivator—Allow me to correct a very common error which appears on page 377 of the last Cultivator regarding the so-called "Morales worm."

Now, Morales is an old Mexican and California surname, and would make a good one for a worm, for we once had a noted robber by that name, but if you will glance at the map of Mexico, immediately below the city you will notice the little state of Morelos, from which the worm took its popular name.

Trusting that if "the worm will turn," it will be back toward Mexico, I remain, as B-4,

Truly Yours,
Braunton.

GOT WHAT WAS COMING TO HIM.

Some Philadelphians visited Richmond, Va., and asking as to the use of this and that large building, were told in every case that it was a tobacco factory. An aged negro gave them the information, and they, tiring of the monotony of the reply, pointed to a white frame building on a hill, and asked whose tobacco factory that was.

The old fellow replied, "Dat, suh, am no fact'ry. Dat am S'n John's 'Piscopal Church, where Marse Patrick Henry done git up an' ax de Lawd ter gib him liberty er gib him deaf."

"Well, uncle," asked one of the trio, "which did the Lord give him?"

"Pears ter me you must be strangers heahabouts," he answered, "else you'd all know dat in due time de Lawd gabe him bofe."—Detroit News-Tribune.

Prof. J. W. Mills of the Pomona Experimental Station has received notice that his duties have been very materially broadened and his field of work enlarged, says the Chino Champion:

"He has been given charge of all university experiment work in Southern California, including the Forestry Station at Santa Monica and the experiments being carried on at Redlands, on the Colorado desert and at other places. While his position is still subordinate to that of Prof. Steubenrauch, superintendent of stations, he relieves the latter of many of his duties. In turn he will be relieved of many of the routine duties of the station here, and will be called upon to travel about the country much more than heretofore. J. H. Barber, formerly foreman of the Forestry station at Santa Monica, and until recently foreman of the Foothill substation at Jackson has been appointed assistant foreman at the Chino Station, and will relieve Mr. Mills of much of the detail work there.

Mr. Mills has been for ten years foreman of the Chino station, and has become a recognized leading authority in California on agricultural and horticultural matters. He will receive the hearty congratulations of his many friends in his deserved promotion. The following tribute is paid to his ability by Prof. A. V. Stuebenrauch in the report of the University Experiment Stations just issued, when speaking of the Chino Station:

"'The officers of this station, especially the foreman, have greater responsibilities than is the case with any of the outlaying substations. The distance from th central station renders tne presence of a fully qualifed foreman at this substation doubly imperative. The foreman is compelled to maintain a rather extensive correspondance in order to answer the many inquiries that daily come to him. The present foreman, Mr. Mills, has succeeded in gaining the confidence of the farmers and fruit growers in the southern section of the State to an extent highly creditable to himself and to the university.'"

The growth of deciduous fruit shipments, from California, is commented upon by Lieut. Governor Anderson, who states that this year witnessed the largest exports in the history of the state. The future shipments he says will only be measured by the transportation facilities of the railroads.

THE "BOSS"
TREE PROTECTOR

Made of Yucca Palm

Is cheap, durable and quickly put on the tree. It prevents Rabbits from destroying your trees. A sure protection against frost, sun-burn, grasshoppers or dry winds. can be easily removed; will last for years.

SWEET CIDER.

There are wines of ancient vintage,
Amber, white, and ruby red,
Whose bouquet is like the perfume
Of sweet incense, it is said;
But to me, the sprakling nectar
Of the Gods, cannot compare
With the cider, made from apples,
That our home-trees used to bear.
And no joy can ever equal
Mine, while stooping down to draw,
From the barrel's open bung-hole,
Fresh-made cider, through a straw.

—L. C. Bishop.

THE RICH PUMPKIN PIE.

"Ah! on Thanksgiving day, when from East and from West,
From North and from South come the pilgrim and guest.
When the gray-haired New Englander sees 'round his board
The old broken links of affection restored;
When the care wearied man seeks his mother once more,
And the worn matron smiles where the girl smiled before—
What moistens the lip and what brightens the eye?
What calls back the past like the rich pumpkin pie?"

JACK'S TWO DINNERS

A THANKSGIVING STORY.

Something very mysterious was going on in the Jarvis kitchen. The table was covered with all sorts of good things—eggs and butter and raisins and citron and spices; and Jessie, with her sleves rolled up and a white apron on, was bustling about, measuring and weighing an chopping and beating and mixing those various ingredients.

Moreover, though she was evidently working for dear life, her face was full of smiles; in fact, she seemed to have trouble to keep from laughing outright, while Betty, the cook, who was washing potatoes at the sink, fairly giggled with glee every few minutes, as if the sight of Miss Jessie working in the kitchen was the drollest sight in the world.

It was one of the pleasantest sights that big, sunny kitchen had seen for many a day, and the only thing that appeared mysterious about it was that the two workers acted strangely like conspirators. If they laughed—as they did on the slightest provocation—it was very soft and at once smothered. Jessie went often to the door leading into the hall, and listened; and if there came a knock on the floor, she snatched off her apron, hastily wiped her hands, rolled down her sleeves, asked Betty if there was any flour on her, and then hurried away into another part of the house trying to look cool and quiet, and as if she had not been doing anything.

On returning from one of these excursions, as she rolled up her sleeves again, she said:

"Betty, we must open the other window if it is cold; Mama thought she smelled roast turkey!"

Betty burst into a laugh which she smothered in her apron. Jessie covered her mouth and laughed too, but the window was opened to make a draught and carry out the delicious odors which, it must be confessed, did fill the kitchen so full that no wonder they crept through the cracks and the keyholes, and hung about Jessie's dress as she went through the hall in a way to make one's mouth water.

"What did ye tell her?" asked Betty as soon as she could speak.

"Oh, I told her I thought pot-pie smelled a good deal like turkey," said Jessie, and again both laughed. "Wasn't it lucky we had pot-pie today? I don't know what I should have said if we hadn't."

Well, it was not long after that when Jesie lined a baking dish with nice looking crust, filled it with tempting looking chicken legs and wings and breasts and backs and a bowlful of broth, laid a white blanket of crust over all, tucked it in snugly around the edge, cut some holes in the top and shoved it into the oven just after Betty drew out a dripping-pan in which reposed, in all the glory of rich brown skin, a beautiful turkey. Mrs. Jarvis couldn't have had any nose at all if she didn't smell that. It filled the kitchen full of nice smells, and Betty hurried it into the pantry, where the window was open, to cool.

Then Jessie returned to the spices and fruits she had been working over so long, and a few minutes later she poured a rich, dark mass into a tin pudding dish, tied the cover on tight and slipped it into a large kettle of boiling water on the stove.

"There!" she said, "I do hope that'll be good."

"I know it will," said Betty, confidently. "That's y'r ma's best receipt."

"Yes, but I never made it before," said Jessie, doubtfully.

"Oh, I know it'll be all right, 'n' I'll watch it close," said Betty; "'n' now you go 'n' sit with y'r ma. I want the table to git dinner."

"But I'm going to wash all these things," said Jessie.

"You go long! I'd ruther do that myself. 'Twon't take me no time, said Betty.

Jessie hesitated. "But you have enough to do, Betty."

"I tell you I want to do it," the girl insisted.

"Oh, I know!" said Jessie, "you like to help about it. Well, you may, and I'm much obliged to you besides." And after a last look at the fine turkey cooling his heels (if he had any) in the pantry, Jessie went into the other part of the house.

When dinner time arrived and Papa came from town, there duly appeared on the table the pot-pie before mentioned and various other things pleasant to eat, but nothing was seen of the turkey so carefully roasted nor of the chicken pie nor of the pudding that caused the young cook so much anxiety. Nothing was said about them, either, and it was not thanksgiving nor Christmas, though it was only a few days before the former.

It was certainly odd, and stranger things happened that night. In the first place, Jessie sat up in her room and wrote a letter; and then after her mother was in bed and everything still, she stole down the back stairs with a candle, quietly as though she was doing some mischief. Betty, who came down to help her, brought a box in from the woodshed; and the two plotters, very silently, with many listenings at the door to see if any one was stirring, packed the box full of good things.

In it the turkey, wrapped in a snowy napkin, found a bed, the chicken pie and the plum-pudding—beautiful looking as Betty said it would be—bore him company; and numerous small things, jam jars, fruits, etc., etc., filled the box to its very top. Then the cover, provided with screws so no hammering need be done, was fastened on.

"Now you go to bed, Miss Jessie," whispered Betty. "I'll wait."

"No, you must be tired," said Jessie. I'd just as lief."

"But I'd ruther," said Betty, shortly. "'n' I'm going to; it won't be long now."

So Jessie crept quietly up stairs and before long there was a low tap on the kitchen door. Betty opened it and there stood a man.

"Ready?" said he.

"Yes," answered Betty, "but don't speak loud, Mis' Jarvis has sharp ears, 'n' we don't want her disturbed. Here's the card to mark it by," and she produced a card from the table.

The man put it in his pocket, shouldered the box, and Betty shut the door.

Not one of those good things ever went into the Jarvis dining-room!

The next morning things went on just as usual in the house. The kitchen door was left open and Mrs. Jarvis was welcome to smell any of the appetizing odors that wafted out into her room. Jessie resumed her study, and especially her practice, for she hoped some day to become a great musician. She waited on her mother and took charge of the housekeeping, so much as was necessary with the well-tried servant at the head of the kitchen. And though she had but sixteen years over her bright brown head, she proved herself to be what in that little New England town was called "capable."

But the box of goodies! Let us see where it went.

* * *

It was Thanksgiving morning in a rough-looking little mining settlement in Colorado. In a shanty rougher and more comfortless than the rest were two persons. One, a man of thirty, was deeply engaged in cleaning and oiling a gun which lay in pieces about him, on the rough bench where he sat—the other, a youth of sixteen, was trying to make a fire burn in the primitive looking affair that did duty as a stove. Both wore coarse miners' suits, and picks and other things about the room told that their business was to dig for the yellow dust we are all so greedy to have.

Evidently luck had not been good, for the whole place appeared run down, and the two looked absolutely hungry.

It was thanksgiving morning, as I said, but no thankfulness shone in the two pale, thin faces. Both were sad, and the younger one almost hopeless.

"Jack," 'said the elder, pausing in his operations, "mind you give that old hen a good boil or we won't be able to eat it."

"It'll be better'n' nothing anyway, I suppose," said Jack gloomily.

"Not much. 'Specially if you don't get the taste of sage brush out of it. Lucky I happened to get that shot at her anyway," he went on; "I've seen worse dinners—even Thanksgiving dinners—than a sage hen."

"I haven't," said Jack shortly; for the mention of Thanksgiving had brought up before him with startling vividness the picture of a bright dining-room in a certain town far away, a table loaded with good things and surrounded by smiling faces, and the contrast was almost more than he could bear.

"Well, don't be down on your luck, boy, so long as you can get a good fat hen to eat, if she does happen to be too fond of seasoning before she's dead!" repiled the other, cheerfully; "we haven't struck it yet, but it's always darkest just before dawn, pou know. We may be millionaires before this time tomorrow."

"We may," answered Jack; but he didn't look as though he had much hope of it.

A few hours later the two occupants of the cabin sat down to their Thanksgiving dinner. It consisted of the hen aforesaid, cut in pieces and boiled—looking very queer, too—served in the kettle in which the operation had been performed. The table was one end of the bench, the table service two jack-knives and two iron spoons—absolutely nothing else.

The elder sat on a bench, the younger drew up a keg that had held powder, and the dinner was about to begin.

But the hen was destined never to be eaten, for just at that moment the door was pushed open in the rude way of the country, a box set down on the floor, and a rough voice announced:

"A box for Mr. Jack Jones."

Jack started up.

"For me! there must be some mistake! nobody knows"—he stopped, for he had not mentioned that his name was assumed.

"Likely not!" said the man with a knowing look, "but folks has a mighty queer way of findin' out," and he shut the door and left.

Jack stood staring at the box as if he had lost his wits. It could not be from home, for no one knew where he went

when he stole out of the house one night six months ago, and ran away to seek his fortune. Not a line had he ever written; not even when very ill, as he had been; not even when, without a roof to cover his head—as he had been more than once; not even when he had not eaten for two days—as also, alas! had been his experience.

He had deliberately run away, because—how trivial it looked to him now! and how childish seemed his conduct—because he thought his father too hard on him! would not allow him enough liberty! wanted to dictate to this man of sixteen! he intended to show him that he could get on alone.

Poor Jack! the only comfort he had been able to extract from his hard lot these many months of wandering, of work, of suffering such as he had never dreamed of—his only comfort was that his tender mother didn't know, his only sister would no more be worried by his grumbling and complaints, and his father would be convinced now that he wasn't a baby. Small comfort, too, to balance the hardships that had befallen his lot since the money he had drawn from the savings bank—his little all—was used up.

"Why don't you open it?" in the gruff but not unkind voice of his roommate, whom he called Tom, aroused him.

"Maybe there's something in it better'n sage hen," trying to raise a smile.

But no smile followed. Mechanically Jack sought the tools to open it, an in a few moments the cover was off.

It was from home! On the very top was a letter addressed to Jack Jarvis in a hand that he well knew.

He hastily stuffed it into his pocket unopened. The layers of paper were removed, and each one was thrown off something new appeared. Not a word was spoken, but the kettle of sage hen was silently shoved on to the floor by Tom as the bench began to fill up. A jar of cranberry sauce, another of orange marmalade, oranges and apples, a plum pudding, a chicken pie, and lastly in its white linen wrapper, the turkey we saw browning in that far-off New England kitchen.

As one by one these things were lifted out and placed on the bench, a deep silence reigned in the cabin. Jack had choked at sight of the letter, and memories of days far different from these checked even Tom's usually lively tongue. A strange unpacking it was: how different from the joyful packing at dead of night with those two laughing girl faces bending over it!

When all was out and the silence grew painful, Jack blurted out:

"Help yourself," and bustled about busily gathering up the papers and folding them, and stuffing them back in the box, as though he were the most particular housekeeper in the world. But if Jack couldn't eat, something, too, ailed Tom. He said simply:

"Don't feel hungry. Believe I'll go out and see what I can find," and shouldering his gun, now cleaned and put together, he quickly went out and shut the door.

Jack sat down on the keg and looked at the things which so vividly brought home, and his happy life there, before him. He did not feel hungry, either. He sat and stared for some time. Then he remembered his letter. He drew it from his pocket and opened it. It was very thick; and when he pulled it out of the envelop the first thing he saw was the smiling face of his sister Jessie, his twin sister, his playmate and comrade, his confidante from the cradle. The loss of her ever-willing sympathy had been almost more to him than all the rest of his trouble.

This was another shock that brought something to his eyes that made him see the others through a mist. They were the pictures of his mother, whose gentle voice he could almost hear, and of his father, whose gray hairs and sad face he suddenly remembered was partly his ".. ..

At last he read the letter. It began:

Dear Jack: I've just found out where you are, and I'm so glad. I send you this Thanksgiving dinner. It was too bad for you to go off so. You don't know how dreadful it was for Mama; she was sick a long time and we were scared to death about her, but she's better now; she can sit up most all day.

"Oh, Jack! Father cried! I'm sure he did, and he almost ran out of the room, and he didn't say anything to anybody all day. But I was determined I'd find you. I shan't tell you how I did it, but Uncle John helped me, and now, Jack, he says he wants just such a fellow as you to learn his business, and he'll make you a very good offer. And, Jack, that's my turkey—my Winnie—and nobody but Betty knows anything about this box and this letter. I send you all my money out of the savings bank (I didn't tell anybody that), and I want you to come home. You'll find the money under the cranberries. I thought it would be safe there, and I knew you'd eat them all, you're so fond of cranberries. I didn't tell anybody because I want to surprise them, and besides, let them think you came home because you got ready. It's nobody's business where you got the money, anyway.

"Now do come right home, Jack. You can get here in a week's time I know.

"Your affectionate sister,
"JESSIE."

(Concluded next week)

RECIPES

Eat Little, but Have That Little Good

THANKSGIVING DINNER SUGGESTIONS.

Following are a few suggestions which we trust will be helpful to the California housewife for the great national day of thanksgiving and feasting:

Oyster Stew.—A good substitute for oysters in the stew is the oyster plant, which can be made to take the place of the oyster when the latter can not be had or the price is prohibitive. The oyster plant is now on the market and should be prepared the same as any vegetable—pared, cut in small pieces and cooked in boiling water. When tender cover well with milk, season with butter, pepper and salt. Serve the liquid only. About six plants will be sufficient to make soup for a family of four.

* * *

Waldorf Salad.—For family of four, take three good sized apples, pare and chop tolerably fine, add bunch of celery, cut fine; take cupful of English walnut meats, cut in small pieces, mix them all together and add good salad dressing. Serve on lettuce leaves. In the preparation of a big dinner the greatest objection to this salad is, that it must be made just before serving, as the apples discolor very quickly.

* * *

Turkey Comes High.—Of course Thanksgiving would not be Thanksgiving without the turkey. Here is where our readers will have the "edge" on their city cousins, as only those who raise turkeys can this year afford to eat them. Twenty-eight and thirty cents per pound is a little too high for the writer to contemplate calmly, and we pass the subject without comment on cooking or serving.

* * *

Cranberry Jelly.—Cook your cranberries till they pop open, then put through a colander to remove skins. Add cup for cup of sugar, boil a few moments. This will make firm jelly and can be turned out on plate when cold.

* * *

A Good Squash Pie.—Boil and sift a good, dry squash (Hubbard preferred), thin it with boiling milk to the consistency of thick milk porridge. To every quart of this add three eggs, two tablespoons melted butter, nutmeg or ginger if you prefer, and make quite sweet with sugar. Bake in deep plate with under crust.

* * *

Plum Pudding.—One pound flour, half pound stoned raisins, half pound suet, half spoonful of salt, sugar and spice, and other fruits as desired. Add milk to make rather stiff paste. Boil for four hours. The old fashioned way is to tie up in a floured cloth and boil. A better way is to put it into empty tin cans that you can close up tight with lids, and boil. There is less danger of being soggy. Put nails in bottom of boiling vessel to prevent the cans from touching and burning pudding.

* * *

For a Sauce.—Take two cups sugar, half a cup of butter, tablespoonful of flour, cream together till smooth. Add boiling water and boil till clear, then add desired flavor.

* * *

Novel Fruit Dish.—Take large pumpkin, cut in half lengthwise, hollow out, serrate edges, and pile high with fruit.

There is invested in the apiary business in this state over one million dollars and the income from this is about half a million dollars annually.

GOD UNDERSTANDS.

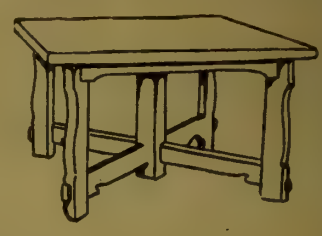
When trials are sore and distressing,
And few are the outreaching hands,
Remember, O Child of Thy Father,
Remember that he understands.
When hearts are turned from thee in coldness,
When hard are thy thongs and thy bands,
Remember, dear soul, that thy Savior
Is near thee—and he understands.
When e'en those who know him and love him
Are cold to thy pleas and demands,
Remember God knoweth his children,
Knows each, and that he understands!
Hold not in thine own heart a hatred
For those who refuse thee their hands;
God's love is deep as the ocean,
Forgive them, for God understands!

—Lida M. Keck.

Dependable Furniture at a Fair Price

Thanksgiving Furniture

Next Thursday when the family assembles to partake of the Thanksgiving Turkey, you will want the dining room to look its finest. You well perhaps want some new piece of furniture suitable for the occasion. A table, sideboard, china closet, some chairs, a new carpet or rug, or, perhaps, some new curtains. We can supply any want in the furniture line. If you will write us what you desire, we will send it to you. We guarantee satisfaction.



If it is convenient call at our store and see our immense stock.

All prices marked in plain figures.

Niles Pease Furniture Co.

439-441-443 South Spring St., Los Angeles.

"The Quality Store."

The Clothes Question

To dress well or not to dress well is no longer a question. The question now is, "Where can I get the best clothes for my money?" This store has settled that question for many years, and is better prepared than ever to settle it this fall.

All the newest novelties and the good old "stand-bys" made into the finest garments that human skill and genius can devise.

FALL SUITS, $10 TO $40

Los Angeles Markets.

LOS ANGELES, Nov. 20.

There is nothing new to write of the local markets. Thanksgiving time is looked forward to with anticipation, and prices are firm in all branches of the trade affected by this date.

Onions are scarce and prices have advanced to $1.50 per hundred.

Yellow Danours are nearly gone.

Potatoes are firm at quoted prices.

Beans are believed to have touched bottom, and dealers profess to see signs of pick-up.

Butter is firm.

Ranch eggs continue scarce and the market for all eggs is very stiff.

Poultry in firm demand and freely offered.

Other commodities steady at jobbing prices heretofore quoted.

San Francisco Markets.

Dairy.

SAN FRANCISCO, Nov. 19, 1903.

The aggregate receipts of butter this week have enabled sellers to maintain the quoted rates on strictly fancy branches. Under grade stock showed a weakness which ran through the quotations of the week. Receipts of all kinds of butter aggregated 47,100 pounds yesterday.

BUTTER—Per lb:

Creamery, extras	32	@33
Creamry, good to fancy	26	@30
Dairy extras	24	@25
Dairy choice	22	@23
Store	18	@20
California storage	24	@27
Eastern Creamery	23	@25

There was no change in the quotations for cheese during the entire week, the demand being about normal.

Eggs and Poultry.

The continued scarcity of fresh ranch eggs held the market on a firm basis, and extra lots of selected whites commanded the extreme price and were closely cleaned up. The medium and lower grades of Eggs were steady in price, but the demand was not very active, buyers giving storage lines the preference.

EGGS—Per doz:

Ranch, selected large	47	@50
Ranch, good to choice	44	@46
Store	Nominal	
California storage	28	@32
Eastern	25	@30

There has been a lively demand for poultry this week, heightened by the near approach of Thanksgiving. Turkeys, especially, are stiffening in price, as the demand greatly over-reaches the supply to date.

POULTRY—Old Roosters, per doz, $5@5.50; young Roosters, $5.50@@6.50; Fryers, $5@5.50; Broilers, large, $3.50@4.50; small, $3@3.50; Hens, small, $5@6; large, $6.50@7.50; Ducks, per doz, old, $4.50@5.50; young, $5.50@6.50; Turkeys, per pound, 18@20c; Dressed Turkeys, per lb, 21@23c; Geese, per pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz, old, $1@1.25; Squabs, $2@2.25.

Fruits and Vegetables.

The market for fruits has been fairly active this week.

Apples, per box, common to choice, 40@90c; fancy, $1@1.50; Lady Apples, $1.50.

Pears—Per box: Winter Nellis, $1@1.50; other varieties, per box, 35@75c.

Persimmons—Per box, 65c@$1.

Quinces—Per box, 35@65c.

Table grapes—Per small box, 40@65c; crate, 75c@$1; large box, $1.50@2.

BERRIES—Per chest: Strawberries, Longworth, $6@10; large varieties, $5@7, as to quality; Raspberries, $6@8; Cranberries, per bbl., Eastern, $10.50@11.50; Oregon, per bx., $2.50@3.

CITRUS FRUITS—Per box: Oranges, new crop Navels, $3.00@3.50; Seedlings, $2.50; Late Valencias, $2.50@3.50; Lemons, $1@3; extra, $3.50; Grape Fruit, $1.50@3; Tangerines, per box, $1.25@1.75; Limes, $4@5.

Vegetables of all varieties have ruled steadily all the week. A liveral quota of good stock has been furnished and readily sold.

No important features marked the transactions in this branch of the trade this week. There was general uniform movement and rather slow trading.

VEGETABLES—Tomatoes, per box, 25@85c; Green Peppers, per box, 25@60c; String Beans, per lb, 2½@5c; Wax, 3@5c; Lima, per lb, 3@5c; Los Angeles Green Peas, per lb, 3@5c; Egg Plant, per box, 40@60c; Los Angeles Summer Squash, per box, 75@85c; Bay, $1@1.25; Cucumbers, per box, 75c@$1; Garlic, per lb, 4@5c; Okra, per box, ——; Marrowfat Squash, per ton, $10@15; Hubbard, $12.50@20.

ONIONS—Yellow, per ctl, 75c@$1.25.

Dried Fruits, Nuts, Etc.

The market for dried fruits has been dull. Ther is practically no change in last week's quotations.

DRIED FRUITS.—Prices for carload lots, f.

Apples—Evaporated, 5@6c; Sun Dried, 3½@4c.

Apricots—Royal, fancy, 9½@10c; choice, 8@8½c; Moorparks, choice, 10@12c.

Peaches—Choice, 5¼@6½c; fancy, 8½@9c. peeled, in boxes, nominal.

Pears—Choice, 6½@7c; fancy, 8½@9c.

Plums—Pitted, 5@7c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 3@3¼c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Black, 4@4½c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1903

crop, f. o. b. at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.35; Two-Crown London Layers, $1.25; Muscatels, Four-Crown Standard, loose, 6½c per lb; do, Three-Crown, 5⅝c; do, Two-Crown, 5¼c; Seedless Muscatels, 4¼c; Seedless Muscatels, floated, 4½c; Seedless Standard Sultanas, 4¼c; Thompson Seedless, Standard Sultanas, lencias, Standards, 4¼c; do, Pacifics, 3⅝c; Orientals, 2⅝c; Malagas, Three-Crown, 5⅝c; do, Two-Crown, 5c.

Seeded Raisins—Prices for limited quantities are as follows: Fancy, 16 oz, per lb, 8c; choice, 7⅝c; fancy, 12 oz, per pkg, 6⅝c.

NUTS—Per lb: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Peanuts, Eastern, 6@6½c; California, Walnuts, soft shells, No. 1, 13@14c; do, No. 2, 11@12c; hard shell, No. 1, 12@13c; do, No. 2, 10@11c.

Beans.

The little business recorded in the Bean market was done in a small way this week and prices continue nominal in character. Slight revisions, however, are noted in prices, Pinks and Bayos being quoted slightly higher, while Small Whites and Pea Beans were marked down a shade. Limas are a little steadier.

BEANS—Prices per ctl: Large Whites, $2.15@2.50; small do, $2.90@3.10; Pea, $3@3.10; Lima, $2.90; Red, $2.90@3; Pink, $2.20@2.45; Bayo, $2.20@2.45; Blackeyes, $2.15@2.35; Red Kidneys, $4.25.

DRIED PEAS—Green, $2@2.50; Niles, $2.35 @2.50.

Live Stock.

CATTLE—No 1 Native Steers, 8@8½c: second quality, 7½@8c; thin Steers, 6¼@7c; No. 1 Cows and Heifers, 6½c; second quality, 5½@6c; thin Cows and Heifers, 4@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½c @4c, gross weight; Ewes, No. 1, 3¼@3¾c; gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb, live weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs and over, 5⅜@5½c; weighing under 130 lbs, 5@5¼c; weighing 260 to 350 lbs, 5@5¼c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

HAY—Prices on Hay, per ton: Wheat, $13.50@17; Wheat and Oat, $13@16; Oat, $11.50 @$14.50; Barley, $10@13; Clover, $9.50@11.50; Alfalfa, $$9.50@12; Stock, $8.50@10.50.

STRAW—Good to choice, per bale, 55@65c.

FEED CORN MEAL—Choice grades, per ton, $30@31.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26.50@29.

BRAN—Per ton, $22@23.

CRACKED CORN—Choice quality, per ton, $30.50@31.50.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

BRAN—Per ton, $21@22.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@ 4.85 per bbl; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—No. 1 shipping, per ctl., $1.38¾; choice, $1.41¼; White Milling, good to choice, $1.42½@1.52½.

BARLEY—Choice, No. 1 Feed, $1.13¾@ 1.16¼; off grades, $1.10@1.12½; Brewing, No. 1, $1.18¾@1.23¾; Chevalier, $1.30@1.45.

RYE—Good to choice, per ctl., $1.25@1.30.

CORN—Good to choice, per ctl: California, new, large Yellow, $1.35@1.40; small, do, nominal; White, $1.35@1.40.

OATS—Good to choice White, $1.25@1.35; Red, $1.22@1.35; Black, nominal at $1.40@ $1.65.

Hops.

The price for new crop is 20@22½c, according to quality.

HONEY.

Prices on Honey were not changed during the week. The supply was fully equal to the demand.

Eastern Markets.

Grain and Produce.

CHICAGO, Nov. 19.—

Cash quotations were as follows: Flour was steady; No. 2 spring wheat, 77; No. 3, 78@81; No. 2 red, 82@83¾; No. 2 corn, 42¾. No. 2 yellow, 44; No. 2 oats, 34⅞; No. 3 white, 34@38; No. 2 rye, 53; good feeding barley, 36@58; fair to choice malting, 43@53; No. 1 flax seed, 94; No. 1 Northwestern, 1.00; prime timothy seed, 2.85; mess pork, per bbl., 11.37½@11.50; lard, per 100 lbs., 6.87½@ 6.90; short ribs, sides (loose) 6.75@7.25; short clear sides (boxed,) 6.50@6.62½; clover, contract grade, 10.50.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	44,700	30,700
Wheat, bushels	358,000	36,400
Corn, bushels	181,400	369,000
Oats, bushels	379,600	193,900
Rye, bushels	22,200	4,300

Chicago Live Stock.

CHICAGO, Nov. 19.—Cattle—Receipts, 17,000, including 1000 western; steady to strong; good to prime steers, 5.00@5.60; poor to medium, 3.45@4.80; stockers and feeders, 2.50@ 4.15; cows, 1.25@4.10; heifers, 2.00@4.75; canners, 1.25@2.40; bulls, 2.00@4.25; calves, 2.00@ 7.35; Texas fed steers, 2.75@3.50; western steers, 3.00@4.50. Hogs—Receipts, today, 35,000; tomorrow, 35,000; 10@15c lower; mixed and butchers, 4.50@4.80; good to choice heavy, 4.60@4.80; rough heavy, 4.30@4.45; light, 4.45@ 4.65; bulk of sales, 4.50@4.65. Sheep—Receipts, 24,000; sheep and lambs steady; good to choice wethers, 3.50@3.75; fair to choice mixed, 2.50@3.25; western sheep, 3.00@3.65, native lambs, 2.75@5.25; western lambs, 4.00@5.00.

DAIRY MARKETS.

On the Produce Exchange today the butter market was firm; creamery, 10@22; dairy, 14@19; eggs, firm, 22@24; cheese, steady, 10@11.

California Dried Fruits.

NEW YORK, November 19.—The market for evaporated apples is easy under a light demand, with prime fruit for future delivery offered a shade under 5½; common, 4@5; prime, 5½@5¾; choice, 6@6½, and fancy, 7. Prunes are a little firmer on the coast, according to private advices, but demand is good here, with prices ranging from 2@7 for all grades. Apricots remain dull, with prices more or less nominal; choice, 9¼@9½; extra choice, 10@10½, and fancy, 11@12½. Peaches, quiet; choice, 7¼@7¾; extra choice, 7¾@8¼; fancy, 9¼@10¼.

CITRUS MARKETS

ORANGE MARKET.

The season is practically over for Valencias. A few selling in eastern auctions at the present time bringing very low prices, and little demand in western markets.

There is a good demand for the Navels being shipped from the Northen part of the state. Prices for shipments to arrive after Thanksgiving will be necessarily low on account of competition throught two-thirds of our markets buying Floridas, Mexicans and Jamaicas, the Northwestern markets only being free from such competition.

LEMON MARKET.

There is little or no demand for standard grade fruit.

SAFE AND SURE METHOD OF PREVENTING FROST

USE DISTILLATE

NO SMUT
SIMPLE AND
EFFECTIVE

Note the following extracts written by prominent fruit growers:

"If growers would generally place pots in their ranches, 25 pots fired per acre, in any frost we have had, would thoroughly protect the trees and fruit. I am sure many more will put in the oil pots next winter."—D. B. Bailey, Rialto, San Bernardino County.

"I am perfectly satisfied with the results. It furnishes sufficient heat to prevent frost damage during periods of cold weather and does not smut the fruit or trees. I find it even possible with these devices to carry the winter blossoms in my lemon grove through for summer crop."—N. W. Moodey, Glen Ellen Orange and Lemon Grove, Centerville, Fresno County.

"During the recent frosts the oil pots saved our crop except a few on the outside of the ten acres of Valencias."—W. R. Wood, Exeter, Tulare County.

"I found that, although the temperature fell to 20 degrees outside the protected area on January 16th, and again on February 14th, 40 pots to the acre gave me all the heat I needed for protection. I estimate that the crop saved on the Camilla orchard this season is worth $20,000. The fruit is heal hy, wtih fine flavor, weight and color."—N. G. Simms, Camilla Orange Grove, Lindsay, Tulare County.

Producing Eggs at $5 Per Dozen

At this season of the year many of the poultrymen are producing eggs at a cost of from $3 to $5 per dozen, and they are selling them at 50c per dozen or more and losing money every day, when now is the time they should be just coining money.

The average poultryman thinks to be saving on the feed by buying cheap feed, the cheapest he can get, chop feed, shorts, etc., or anything that is the cheapest and he hauls it home and feeds three or four sacks of feed to get one dozen eggs and thus he produces eggs at from $1 to $5 per dozen.

It would be better for the poultrymen to pay $30 a ton, $40 or $50, or even $100 a ton for feed and get feed that produces eggs. Even at $100 a ton, a feed that three pounds of it fed to hens that will make them lay one dozen eggs, is cheaper than feed that you have to feed three or four sacks to get one dozen eggs.

Producing Eggs at 17c a Dozen on Coulson's Egg Food

L. K. Pierce on Mt. View avenue, Petaluma, has 450 hens which he feeds Coulson's Egg Food. It costs him $2.00 per day to feed the 450 hens and a few days ago when eggs were bringing 50c a dozen he received $6.00 per day from eggs sold, making a profit of $4.00 a day on 450 hens.

D. H. Ward, of Cotati, feeds Coulson's Egg Food and gets an average of 90 dozen eggs a week from his 500 laying hens. When eggs were 50c a dozen, Mr. Ward received $45 a week from eggs sold, and the cost of feed by feeding them all they will eat of Coulson's Egg Food as a mash, and wheat in the scratching pens is not over $16 per week. So Mr. Ward clears over $25 a week on 500 hens by feeding Coulson's Egg Food.

The Secret of Success in Poultry Keeping

The day has passed for making money with poultry by old fashioned methods. The farmers and poultry keepers that are making any money today are the wide-awake, progressive men and women, who study their business, who take advantage of the best facilities, latest improvements, modern methods, etc. In short they keep up with the times. They are the leaders and others who don't keep up to date are unable to comprehend the mystery of their success.

Incubators have taken the place of setting hens, and the study of the poultry keeper now is to make hens profitable in egg production, and to know what is needed and what is best when so many things have been called good for egg production.

We believe the majority of poultrykeepers obtain about one-half the quantity of eggs their hens are capable of laying per year, and they must keep a hen four years to get as many eggs as might be produced in two years.

A hen can be made to produce as many eggs in the first two years as she would naturally in four years.

Business in poultry is poultry for profit, and it is the most profitable branch of any farmer's business if properly cared for.

The hen must be kept in laying condition by feeding the proper food. Coulson's Balanced Egg Ration should be fed to every laying hen one meal a day the year round.

Coulson's Egg Food is no longer an experiment. It has been tested, tried and proved to be a success.

We know whereof we speak. Coulson's Egg Food will double the egg production of your hens.

The profit of poultry keeping depends upon the production of eggs, and while there are many other things to be considered in care of poultry besides proper feeding, yet we find that the most important thing of all, special feeding for eggs, has been overlooked by many of the poultry keepers. The analysis of eggs shows them to contain a variety of ingredients in definite proportions. To produce eggs in quantity, with economy, it is necessary to feed these component parts in proper proportions and in form more easily assimilated and digested.

Many have failed to make poultry profitable because they did not fully realize this.

Coulson's Balanced Ration Egg Food has been tested, and proved to be successful, and is now fed exclusively by many of the largest poultry raisers in the Southern, as well as Northern and Central parts of California.

It is just as proper and necessary to feed hens especially for eggs as it is to feed cows especially for milk, and sooner or later poultry keepers will wake up to this fact.

Loading Cars with Coulson's Egg Food

Chas. Miles on His Annual Trip Through Southern California—Photo taken at Watsonville

Profits from Poultry
Depends Upon How and What You Feed

Coulson's Egg Food, a balanced ration of ready mixed feed for laying hens is what makes the hens lay lots of eggs, and now that eggs are bringing a good price you should purchase a ton or two of this feed and make some money out of your hens.

Raising Winter Vegetables

BY S. J. MURDOCK, LOS ANGELES

It is a grave question with many tillers of the soil what to grow to get the best results for the labor, seed and other expenses bestowed. For a large majority this problem is already solved by environments not easily or quickly changed, but to the new comer and those just starting as farmers, it is quite a serious question.

We well know that the citrus industry claim first place with the majority of persons coming from the East. But for the man of moderate means it takes a long time to get an orange grove into bearing so as to be a paying investment. There must be some source of income to meet necessary expenses while the grove is maturing, and there are many localities not adapted to citrus fruits,and also many persons not fitted for the occupation of fruit growing, so it will be necessary to turn to something else for an occupation. We believe there is one branch of soil tilling that offers many inducements to the beginner, or to those who have vacant land between growing trees.

Growing winter and early spring vegetables both for shipment and for local consumption embraces a wide scope of efforts, as the territory and the markets to be supplied are yearly increasing in rapid proportions from the tourists, and settlers locating in the state.

We know not the seasons for fresh garden truck as we did thirty-five years back, when the first green vegetables were eagerly sought. The trade wants cabbage, carrots, beets, onions, radishes, lettuce, and turnips the year round, and expect asparagus, peas, cucumbers, tomatoes, parsnips, celery and cauliflower, most of the time. Not many persons realize the amount of fresh vegetables consumed in the city daily, as there is an ever increasing demand for first class goods. Often fancy prices are realized by the careful grower. We cannot raise the vegatables of fifteen or twenty years ago, make a success of the business, for there is as much improvement in vegetables as in many classes of fruits.

While the Chinamen have the bulk of the retail trade, and to some extent some lines of the wholesale trade, there are many white men who are making a specialty of vegetable growing, and there is room for many more. But the man to make a success of the business, he must be abreast of the times, not only grow good truck but know how to pack and market the same. Location will often solve the problem of what to grow, and it would be folly for a person whose land is situated in the warm foot hills to grow celery, cabbage, or cauliflower, or for him who is located in the cool moist valley to try to compete with his neighbors of the warm belt in raising string beans, early tomatoes, and other tender vegetables for winter and early spring sales. Each locality should grow the crops best adapted that section. There are many points of vantage to consider in choosing this line of production, such as quick returns, variety, utilizing home help, light work and a healthy occupation, also suited to those of small or medium sized bank accounts. To be sure the new comer will have to learn the wants of the trade, and forget or drop many of the essential points that are considered necessary to the eastern gardener. We have no long cold winters, no snow, yet we have some frosty nights in the valleys that will nip the tender plants ,while beets, carrots, parsnips, turnips, cabbage, onions and other hardy vegetables grow through the whole of the so-called winter month but not so rapidly during December and January as the periods of longer days and more sunshine. A great many eastern people believe that our summers here are quite hot, while the fact is we have a great variety of climate in Southern California. We have many miles of ocean front that temper the air for quite a distance inland, and many enjoy the summers equally as well as the rest of the year. There is no week in the whole year that we can not plant vegetables of some kind unless possibly an extra long wet spell when the soil may be too wet to work, but such a period has not occurred in the last seven years except on naturally quite moist land.

We do not think the business can easily be overdone, and we are sure there is a big demand for first class garden truck. The trade of Arizona, and New Mexico, is still growing larger each year, and while the eastern shipments are often limited, or curtailed by the lack of good shipping stock, there is but one California, and as there is but a limited area in the state, where winter vegetables are grown, over production will not exist till all wants are supplied. The question of profits is a rather difficult one as the profit is so large, in some instances, as to almost exceed belief, and in other cases so small as to be trifling, but this condition can generally be traced to bad management, lack of experience, or insufficient means to give the necessary labor required, yet on the average, returns are fully as good as many other branches of industry.

In conclusion, let me say, the vegetable growing interest in Southern California, especially the early vegetables, onions and that class, will pay well, and the soil is abundantly productive if properly cared for.

CALIFORNIA ONION FIELD Courtesy of Sunset

State Fruit Growers' Convention will be held at Fresno Dec. 8th.

SEED POTATOES.

W. J. J., Yuma, Arizona, inquires whether seed potatoes can be procured from the northern valleys of Arizona. The writer has attempted to interest farmers in the valleys to the north of Phoenix in growing seed potatoes for southern customers, but finds that they have little incentive for so doing. The tillable and irrigable land in the higher, cooler valleys is limited in quantity, and the demand for farm produce at the mining camps good. Hence prices are so high in most of these localities that there is no need of shipping many potatoes to southern points.

Since in the warm interior valleys it is well nigh impracticable to keep seed potatoes over from one season to another, nearly all the potatoes planted in them are obtained each season from California. Early Rose and Triumph are the only two varieties generally planted, and these are shipped in at planting time especially for the purpose, the price usually being about $2.75 per hundred at Phoenix.

As indicative of the tendency of the times, the San Francisco Chronicle says: "One of the beet sugar exploiters openly urged the American farmers in Colorado to have their wives and daughters hoe and weed the beets, which he described as eminently healthful and agreeable occupation, well-suited to women." The Chronicle promptly protests against introducing such a foreign and un-American slavery of American women and girls as that suggested.

A Farmers' Institute will be held at San Diego Dec. 3 and 4.

The rose has its thorn and even the beautiful golden rod is filled with hay fever.

ITEMS OF INTEREST.

Let Us Give Thanks.—There are many reasons why the American people should be thankful today as they sit down to their annual feast of good things. In the first place we should be thankful that we are a free people. By this it is not to be considered that liberty and license are synonomous terms and that they are to be transposed to suit the caprice of an ignorant or vicious class. We are to respect our laws, for by the observance of them is our liberty secured. We are not to think nor are we to act as if freedom means license to disobey the properly constituted authorities of our land. The law should be supreme and our reverence for it such as to make us ever mindful of the blessings which order and observance of our laws bring. We should be thankful again for our educational opportunities. No nation in the world enjoys such qualifications to educate her youth as ours. Our common school system is the basic principle of our growth and development. We foster it, as if it were indeed the corner-stone of our liberty. Our Puritan fathers and mothers realized the importance of leaving, as a legacy to their children, the blessings of a good school system, and to this end sought to create a broader desire for education than was entertained by the old country from which they emigrated. Washington most fervently preached this doctrine and it has been handed down the century until today, more than any other, it represents the active principle in our American life.

When we compare our ratio of illiteracy with other countries we should be exceedingly grateful for the blessings of our educational system.

Again should we be thankful for the church privileges which are accorded the nation. To millions of our people this means so much. They have been educated to believe in the church. Their happiness depends on their freedom to worship God according to the dictates of our conscience. In this government no restraint is put upon the religious principles of any individual so long as he does not use his religion as a cloak for the commission of unlawful acts. There are those who think our freedom too broad in this particular; but we may always feel assured, so reverent is our feeling for things holy, that no sect will be permitted to abuse the religious sentiment of the land by going outside of the teachings of the Divine Master. If we follow those teachings well we need have no fear of the future. Among our numberless blessings were our intrepid forefathers and mothers. To them do we owe all we are as a nation. But for them our country might be the property of some government like Spain, without progression, civil or religious, and we the serfs of kings instead of the kings and queens we all are by reason of our civil and religious liberty.

Let us then rejoice in life which is so full of sweetness to all who court it, rejoice in our country, the grandest on earth; rejoice in our state, which of the cluster composing the Union is the fairest of all.

* * *

A Fruitarian Diet.—The Agricultural department of the University of California has just issued a bulletin in relation to a diet which embraces the combining of fruits and nuts into a perfect diet for the support of the human body. The investigation, it seems, has been going on for some time, but the university has but recently reached a conclusion, which it could support. In this bulletin just issued, embodying the results of experiments, it is stated that "after exhaustive trials the fruitarian diet is found to be as valuable to the body as the ordinary mixed foods and the cost is about the same."

The intelligence afforded in this pamphlet is pleasing, in that is shows we can subsist on a much more healthy and much less expensive diet than we are at present using. The vegetarians have long contended that the use of meat and animal fats are deleterious to the health of man, while our mental scientists aver that "as we eat so are we." If we eat pork our nature becomes coarse and brutal. If we use much beef we create coarse tissues, and in time, bring on sciatic rheumatism and other ailments.

Now the fruitarian teaches us that we may live and thrive on fruits and nuts put up in a sort of balanced ration at from 18 to 20 cents a day.

We shall wait with interest the further development of this idea. If it shall prove what is claimed for it, we have indeed reached a very satisfactory condition, for it will eliminate all annoyance incident to the preparation of our meals, but it will vastly serve to solve the "servent girl question," and therefore bring a boon to the housewife. By all means let our benefactors press their investigations further; that we may know to a certainty with what economy we may furnish our daily meals, and how many years we may expect to add to our lives by the adoption of the fruit diet.

* * *

Growth of Pacific Coast.—The expansion of trade and the internal growth of the Pacific Coast in the past four years is best shown by the annual bank clearings for the years 1892, 1894, 1901-2. "In those years, says the Financial Chronicle, the aggregate clearings of the banks in the cities of Los Angeles, San Francisco, Portland, Seattle, Spokane and Tacoma were $1,067,000,000, that from this there was a drop to $832,000,000 in 1894; that 1901 saw the total go up to $1,726,000,000, while in 1902 there was a further advance to $2,129,000,000. Every one of the points has shared in the wonderful upward movement, the clearings at San Francisco in the years from 1894 to 1902 having risen from $658,000,000 to $1,373,000,000; those of Los Angeles from $47,000,000 to $245,000,000; those of Seattle from $27,000,000 to $192,000,000; those of Portland from $56,000,000 to $154,000,000; those of Spokane from $14,000,000 to $88,000,000; and those of Tacoma from $29,000,000 to $75,000,000. Everyone knows that the foreign trade of the Pacific Coast has been expanding in a very rapid way during the last few years.

* * *

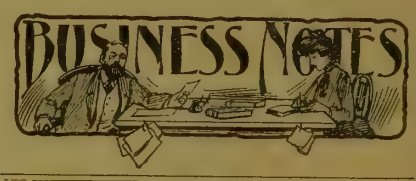
California's Wealth.—California annually produces wealth as follows:

$17,000,000 in gold.
$10,500,000 of petroleum.
$72,500,000 in copper.
$6,000,000 miscellaneous metals.
96,000,000 pounds of raisins.
150,000,000 pounds of prunes.
50,000,000 pounds of dried fruits.
450,000,000 pounds of oranges.
23,000,000 pounds of nuts.
350,000,000 pounds of fresh fruits.
43,000,000 gallons of wine.
18,000,000 bushels of wheat.
16,000,000 bushels of barley.
4,000,000 bushels of potatoes.
115,000,000 pounds of beans.
160,000,000 pounds of beet sugar.
11,000,000 pounds of hops.
7,000,000 pounds of wool.
4,000,000 pounds of honey.

And many other things too numerous to mention.

* * *

To all our friends, both far and near,
The Cultivator sends good cheer.
That you may feast to beat the band,
Here is a turkey right at hand.



STILL GROWING.

We spoke last week of the exceptional growth of the Cultivator as to its circulation, and, as noted then, we put up nine thousand five hundred papers for our regular list, which is this week increased by two hundred more, or a clean issue of nine thousand seven hundred. Better than all, the boys who are in the field scattered over the state looking after the interests of the paper send in so many hearty congratulations and commendations from old subscribers that it is most pleasing to know the hold which the paper has with its vast family of readers.

Equally as gratifying is the feeling towards the paper by our advertisers. Last week's paper showed practically fifty columns of advertising matter, which is by long odds the greatest which has ever appeared in the Cultivator. That feeling of confidence may continue and that it may be justified by the returns which will be received, is the firm belief of the management of the paper.

Another factor which has in it a lesson is that the patronage has a wider range as to location in the state than ever before. From new sections each day comes new friends who become believers in the paper. But the best of it is that the old patrons are still staying with the paper, as may be indicated by the letter below.

"S. J. Smith, wholesale and retail dealers in Lambert Gas, Gasoline and Distillate engines, Aermotor windmills, 129 North Los Angeles St., Los Angeles, Cal., Oct. 10, 1903.

"California Cultivator—I am in receipt of your favor of the 8th inst., re. what we think of the "Cultivator" as an advertising medium. In reply will say that we have kept our advertisement in the "Cultivator" continually for about ten years past, from which you should be able to draw your own conclusions. Very truly yours,

S. J. Smith.

Mr. Smith has sold Lambert engines for many years to irrigators and farmers who have use for a thoroughly reliable power and this sale has been largely increased through the columns of the Cultivator, that is, if we are correct in our inference drawn from his letter above. Mr. Smith believes in handling goods and reaching good people in selling them.

* * *

Another advertiser who has been not so constant because of being in a different business, also in having a business which is not so large as some others, has been J. W. Bairstow, of Hanford, Cal. The Hanford nurseries have supplied the foundation of many successful deciduous orchards of Central California and more recently have branched out, covering many other sections of the state, as well as Washington and Oregon with his new and popular Tilton apricot, which he has introduced and pushed into the market.

This apricot is one that bears immense crops even in years when other varieties are almost a total failure.

This wonderful new apricot has not failed once since it began fruiting twelve years ago. While all the leading varieties have failed several times during that period, the Tilton has gone on and fruited continuously each successive year, producing unheard of crops of the largest and finest flavored apricots that have ever been seen.

This tree has not only proved a vigorous grower and regular annual bearer but has large sized, finely flavored and beautifully colored fruit.

This year was no exception and while Mr. Bairstow has hollered loud and long in extolling the merits of his pet fruit, he seems to be making good each season.

* * *

We do not know that the varieties of grapes which have been found adapted to California conditions have ever been numbered or not, they certainly seem almost numberless. There are a few; however, which attract more attention by their being prolific bearers of wonderful fine fruit. One of these perhaps not so well known as some others at least, is the Black Cornichon; a crate of which is on the table before us as we write and may give some coloring to this item. Be that as it may—handsomer grapes were never shown, and to our taste, never better eaten.

These grapes will run practically an inch and a quarter in length, some of them running to one inch and a half in greatest length. They are dark purple or almost a black, are very fine flavor, very thick skin. They ripen and remain on the vines from October to Christmas and, owing to their being so firm and thick skinned, may be kept in cold storage until the first of February. Thus it may be seen they are not only beauties but money-makers.

The vineyard from which these came belongs to Mr. Ingveldsen, of Pasadena, and he tells us that these grapes are readily picked up by buyers who take the vineyard in a lump sum, paying at the rate of two hundred dollars per acre for the fruit.

Not so worse.

Especially when it is considered that the grape is a comparatively easy fruit to cultivate and care for. Notwithstanding that, Mr. Ingveldsen's vineyard would tell of good care, thorough cultivation, and intelligent handling of the vines at all times; and sure it is that he has raised some beautiful fruit.

Mr. Ingveldsen's vineyard is on the corner of Hill and Washington streets, of Pasadena, and he is ready to contract for cuttings for this season's delivery.

TONS OF SEEDS.

The amount of business done by the Germain Seed House of Los Angeles can be appreciated by a few moments' look through the basement, store room and nursery yard of that large concern.

The salesroom is immense and back of it, where seeds of all kinds are stored, there is already in stock possibly seventy-five tons, with the necessity of providing for storage for a large amount more within the next few days. These seeds range in price from four or five cents up per pound. Back of this storeroom are the yards of the nursery stock, which is a most handsome showing of fine stock.

General Agriculture

THE MANGO.

Having some inquiry as to the mango, the Cultivator has written to P. H. Ronsee of Riverside with request for some information which he has given to us ,and from which we quote:

The mango is one of the most valuable and delicious of East India fruits. In Southern Florida, it adapts itself to poor sandy soil, also to the heavier muck soil. The best soil, however, is thought to be high, well drained sandy land. I have seen the mango grow higher than scarcely any other tree would grow, in almost pure sand.

This tree is practically a tropical tree, hence will not stand a low degree of cold. Do not know how much cold it could stand without dropping its leaves. I know of one tree which was three years old, five feet high, which in 1895 withstood four degrees of freezing and did not drop its foliage; this tree was however dormant. Surely a hard frost will kill the tree back to the roots in which case the trunk should be cut back at once to sound and live wood. To succeed in California ,the mango should be planted along the foot-hills in protected places or along the coast line of San Diego and Santa Barbara Counties where there may be least danger from frost.

The tree in Mexico grows forty to fifty feet high, very much like the magnolia tree is upright in growth and is very handsome. The flowers are produced in March and April at the end of the branches, and yield many crops of golden or green fruit. The leaves are beautiful, six or eight inches in lenght and in new growth are wine colored. It will bear three years from the graft or five years from the seed. Grafting is all done on the seeding mango, it does not come true from seed. From what I have seen in Mexico and here in Riverside, I should judge that it would need about the same amount of water as an orange or lemon tree.

There are many varieties among them as the Mulgoha which is said to be the best variety. The fruit is large, weighing from a half to a pound, color golden, dotted with many brown dots rich, sweet and of fine flavor. The tree is an enormous bearer producing as many as twenty-eight or twenty-nine thousand mangoes on one tree in its native land.

The fruit has never been offered in any quantity in Southern California markets, although it has sold quite extensively in the East where it is imported from Mexico and the Islands. Trees may be had in Southern California costing from fifty cents to one dollar and fifty cents each. The planting should be done in March, April or May.

SOME LOS ANGELES COUNTY APPLES.

The exhibit of Los Angeles County apples now at the Chamber of Commerce is instructive as to the possibilities of that county in apple culture. As an apple section it has never been particularly popular notwithstanding a very material section of the rich lands between the city of Los Angeles and the coast on the south. The conditions here have been known to be favorable, and a few have taken advantage of them and are today producing some fine fruit.

This exhibit is made by Fredrick Maskew of Long Beach; E. H. Henry, Downey; S. P. Walser, Downey; H. C. Harper, Downey; J. P. Squires, Downey; T. R. Gagley, Downey, Wm. Wood, Rivera; W. H. Graig, Compton; Russell Kingcaid, Cerritos.

There are Pearmains, Belleflowers, Hoovers, Arkansas Beauty, Missouri Pippins, Smith Cider, Kentucky Redstock, Arkansas Black.

Of these, the three varieties, that is for commercial purposes are the Pearmain, Belleflower and Missouri Pippins.

We hope to give special attention to apples in Los Angeles county in an article within a short time.

LOSSES FROM DESTRUCTIVE INSECTS.

Insects are such insignificant things that, even when we know them to be injurious, we rarely comprehend the extent of damage they do and the amount of loss they cause us. Dr. H C. McCook in an article in Harper's Weekly gives some figures in this matter that are startling to one who has never studied it. The chinch bug, he says, caused a loss of $30,000,000 in 1871, upwards of $100,000,000 in 1874 and $80,000,000 in 1877. The Rocky Mountain locust in 1874 destroyed $100,000,000 of the crops in Kansas, Missouri, Nebraska and Iowa. The cotton caterpillar causes an average loss of $15,000,000 in the Southern states, while in 1868 and 1873 this loss was doubled. The grain weevil inflict an annual loss on us of $40,000,000 and the codling moth destroys from $30,000,000 to $40,000,000 of our fruit annually. These are but a few of the destructive insects which are working in our crops, and, if it were possible to compute the damage done by all, the figures given above would appear insignificant. It is a fortunate thing that for most of our destructive insects nature has provided enemies that keep them in check.—Exchange.

Thomas Browning, of Fresno, writing of American grown apples, disagrees with the Cultivator in its statement that our apples have a relish and flavor not found in the product of foreign lands, although he says: "England is America's largest customer for apples." "Connoisseurs in taste and gastronomic art," says Mr. Browning, "concur that American apples are subordinate in quality and relish both to English and Canadian grown apples."

The fact that England is one of the largest buyers of our apples shows in what esteem that country holds our fruit, and proves the truth of the Cultivator's statement. The average Englishman knows what good fruit is—he always wants the best. If American grown apples were not to his liking he wouldn't buy them, for he can get them in countries nearer home at less cost. Frank Carpenter is authority for the statement that no better apples are grown anywhere than in this country.

The San Francisco Chronicle says of the loganberry that it is naturally a trailing vine running upon the surface of the ground and reproducing itself by forming roots where it happens to get covered with earth, or without that, where the ground is sufficiently moist. Nature cares nothing for good clean berries, readily accessible, and this method of growth answers her purpose as well as any other. Man, however, wants the berries, and, therefore, trains the canes to trellises or stakes, which involves the labor of layering each year a sufficient number of tips to produce the bearing vines for next season. During the growing season bend down a shoot, covering it an inch or two and hold it in place with a forked stick, but letting the tip project out of the ground. As the vine grows the operation can be repeated with the same twig. In this way bearing wood may be obtained for the next season, or in the spring the vines may be divided for use elsewhere.

BY J. W. JEFFREY, LOS ANGELES

HUMOROUS AMENITIES.

The offer of the manager of one of the leading organs of the commission merchants in the East, to blow hot or blow cold upon the business of the California Fruit Agency according to the liberality of the latter, in advestising patronage, has brought forth a reply from the agency's Los Angeles office, that is convulsing the fruit trade circles of the continent. We have had the privilege of reading the reply to the organ's mercenary representative who offered to modify his opposition to the agency's program if the latter would only advertise in the journal. It is a gem that only the climate here and the habit of holding one's own against the effete opposition of a frightened trade can produce. It is to be hoped the Cultivator may secure this little literary gem and publish it to add to the gaiety of the holiday season. It proves that the safest plan for the eastern critics to follow is to keep away from the danger line, to curb their desire to be smart at the expense of Californians, to refrain generally and to avoid difficulties of all kinds, wherever it is possible. Mr. Tuck's friends should sing him the old Santa Monica refrain, "Mother, may I go out to swim," "O yes, my dearest, but when you put your trousers on, don't you go near the water."

Commission men rampant.—This is the first season the commission merchants of the East have shown general opposition to the co-operative plan of marketing citrus fruits. They have never approved of it, to be sure, but heretofore they have regarded it as but an experiment in which at best only a portion of the growers had joined, with the prospect from their point of view of an early demise of the co-operative institution that had given them some uneasiness but little fear of the final outcome. We cannot blame the eastern merchants for not being able to size up the situation here, for few of them have had much personal contact with the representatives of the co-operators and they could not otherwise find out the true situation. We can trace out a few causes that led the commission merchants to believe nothing could succeed unless it had their sanction and support.

In the first place, commission dealing as practiced by these distant and often irresponsible dealers, is a subversion of the laws of barter and trade. It disputes the fact that it is as much the business of the orchardist to sell his fruit as to grow it. Because circumstances or usurpation have caused the grower to submit his products to the irrevocable charge of the commission men, the latter have assumed that that is the only practice possible, or the only right method of conducting the sale of fruit. On the other hand the cardinal principle of the cooperators is the old fashioned one of going to market with what one has to sell, and to keep it in hand till the bargain of sale has been made and the cash turned over in exchange for the commodity. The Exchange formerly, and now the California Fruit Agency enunciate no new commercial principle when they declared to sell their own produce, but rather reaffirmed an old one, that was held thousands of years ago, for example when Jacob and Esau made their famous trade, and delivered the goods without the intervention of the middleman, It cannot be disputed that the commission merchants had reason for believing that their cinch was everlasting. We all know of commission men who have grown gray in the business established by their grandfathers. Generally, or almost universally the producers of perishable goods have acknowledged this sway till it began to be claimed an indispensible adjunct to the fruit business. Through generations of dissatisfaction, loss and demoralization, the eastern farmer has submitted to the surrender of his produce without hope of influencing its final disposition or effecting its selling price—without expecting to know, in fact, whether his returns added to the commission charges were of the figure reported by the merchant. Now that this long-distant "graft" has been eliminated it is little wonder the former dealers in citrus fruits are trying to raise a cloud around the operations of the new selling agency. Southern California today is the archievement of the orchard and farm, but such achievement would not have been possible had the fruit industry been left dependent upon the system of selling through distant and often unreliable commission houses. The Cultivator said three years ago, "We do not believe that anything but the masterful enterprise of the few hundred men who fought to a finish all opposition, could have produced the results Southern California has been enjoying the last few years in a financial way." These men did it by giving the first great blow to the commission system that wrecked the business of fruit growing ten years ago.

Not only have the commission merchants failed to realize that they are not a necessity but they fail to grasp the idea that it is plain business sense for the grower to look after his own affairs. The growers have discovered and demonstrated that the hard grind of commercial competition among themselves, either in selling outright, individually or coming into contact with each other in the commission stalls is ruinous. Regard for each other's interests may seem altruistical, but it is not when it eliminates competition, destroys unnecessary factors between producer and consumer, and cheapens the service of preparing the fruits for markets. It has proven a strictly business proposition of paying proportions, and we need no longer apologize for the application of a practice that has proven a clean-cut, financial success. When the first selling agency of 1896 began to cut out the maverick takers of unearned profits, their lashes began the requiem of commercial egoism that had thralled the farmer so long, and set forth with the logic of success that the so-called altruism was but the reassertion of the old principle, "In union there is strength," and that fellowship in gain or loss, was preferable to leaving the individual helpless prey of the unscrupulous, and a foil for the destruction of the whole. What of the commission system yet remaining with the operations of the agency, has been brought home, and is between the grower and the dealer, he has been patronizing for years. The grower has no fear now of his home commission man, his fruit packer in fact, giving him fraudulent returns. That is impossible under the system that has eliminated the free lance commission merchants and which is causing such a commotion in the ranks of the eastern traders.

California Horticulturlly

BY JOHN ISAAC, SACRAMENTO, CAL.

NEEDED HORTICULTURAL LEGISLATION.

The association of County Horticultural Commissioners of the state will hold their annual session at Fresno during the week of the convention. Some very important business will come up before them, chiefly in the line of needed legislation for the more effective carrying out of their work. Under our present laws there is an open door for the introduction of infested stock into the state in spite of the most strenuous efforts of the county commissioners or the State Horticultural officer. In some of the counties the horticultural laws are entirely ignored and the supervisors refuse to appoint a board of horticultural commissioners or to take any measures whatever to prevent the orchards of their counties, or of the state, being made the receptacle for outside pests of any kind.

In others the supervisors have appointed a dummy board in order to comply with the law, with the understanding that the board shall not do its duty. In the efforts of these recalcitrant counties to nullify the law, the supervisors can hardly realize the extent of damage they may be doing. The one great industry of our state is horticulture, our fruit and fruit prodûcts amounting to more than tne output of any other industry. Our legislators have endeavored to guard this great industry from more ills than it now has to contend against, and the greatest of these ills is the introduction of new pests and diseases. Yet there are supervisors in our state, so ignorant or careless, that they will leave an open way through their counties for the introduction of pests which may cost our state and our fruit growers millions of dollars. Fortunately surrounding counties have careful inspectors and the state faithful officers. By this means the danger is minimized, but in spite of this, new pests, and serious ones, have been introduced in this way, and the dread black aphis of the peach, and the hop louse, have found an entry through these unguarded counties, in spite of the best efforts of others. The better guarding of these open spots will be a matter for the consideration of the commissioners at their next meeting.

* * *

THE RAISIN MEN'S PROBLEMS.

The Raisin Growers' Association is facing a serious proposition, in the handling of the season's crops. There are from 5000 to 5500 carloads of new crop raisins to be disposed of. The crop this year is the heaviest in the history of the raisin industry in the state, and while the great bulk of it is in the hands of the association, there are yet enough on the outside to inspire a feeling of uncertainty on the part of the jobbers, who do not know when these may be thrown upon the market, and prices depressed. As a result, buyers are conservative, and sales are light. The growers' contract is of but one year's duration, so the crop has to be handled speedily, if at all, and the association is faced with the conditions of an enormous crop, slow markets and short time. It is no wonder that they feel uneasy as to the outcome.

* * *

RAIN AND WHEAT IN THE NORTH.

A week's heavy rains have put the soil in the Sacramento Valley and the lower San Joaquin in good shape for farm work, and the plows are now busy in all directions. In spite of the fact that the yield of wheat per acre is steadily lessening, and that there is very little profit in it, there will still be a very large acreage put in this season, probably the usual average. This is due largely to the fact that very much of the grain land of the upper country is worthless for any other crop, and it must be sown to wheat or left idle. In many of the great wheat districts there are no means for irrigating; in some, water is not available, and the farmer is left with Hobson's choice—wheat or nothing. It is not a question of profit with him any longer, but, in many cases, of sufficient returns to enable him to keep his head above water. In the sections where water is available, the wheat farm is gradually giving way to the orchard and other branches of agriculture, and in all, the matter of irrigation and diversifications of farming is one being seriously considered. The conservations of the winter rainfall and the economical application of water to land are questions which are forcing themselves upon the northern wheat farmer, and in a few years they will be solved, with the effect that only such lands as are entierly out of the reach of water will be used for wheat.

AN UNNECESSARY SCARE.

I notice the following item in the Cultivator of the 13th, inst.:

"Horticultural Commissioner J. P. Keller, of Alameda county, says just now large quantities of limes and lemons are being shipped into this state from Mexico, and that nearly all of them are infected with red scale, and he fears California plant life will be injured by it.'

Mr. Keller is evidently in error here or he has been incorrectly quoted, for the red scale is never found on limes from Mexico, and lemons are not imported for sale from that country. Sometimes passengers from Mexico will have a few lemons in their baggage, but these are always carefully examined and are never found infested with red scale. The only scales found on the limes are purple and ficus, and both of these are very rare. All this fruit is carefully inspected before it is admitted, and nothing that is likely to be detrimental to our orchards is permitted to enter. Either Mr. Keller is in error or some one is trying to work up a sensation. Any fear as to the injury to plant life from red scale is unnecessary as we have it already firmly established and any orange grower in Southern California knows tnat it is as bad as it can be now.

* * *

AN IMPORTANT CONVENTION OF FRUIT GROWERS.

The Fruit Growers' Convention, which is to be held in Fresno on December 8th to 11th, gives promise of being the most interesting and best attended ever held in the state. A special feature will be made of the grape and raisin, in their various phases, and as this subject is one of immediate interest to the whole state, it promises to elicit more than ordinary discusson. The unlooked for depression in the price of wine grapes by the Wine Association, will be taken up, and methods for the wine men to escape from its cotnrol will be considered. The steadily increasing output of raisins and the best methods of disposing of them will also come up, and both of these questions will be dealt with by the leading men of the state. M. Theo. Kearney will give his views and they are always sound, on the matter of handling the dried fruit product. Transportation and co-operation will be subjects of special interest. Mr. Naftzger will give the work of the Orange Growers' Association, and Hon. Alden Anderson, the work of the fresh fruit shippers, The California Fruit Distributors. There are very many other matters of importance to every fruit grower coming up, and as the program is printed in full elsewhere, it should be carefully read and every fruit grower should arrange to attend the convention.

Mr. Katzenstein, of the Earle Fruit Company, has, for three years, kept a record of the deciduous fruits shipped out of California. Here it is in carloads up to October 24, this year:

	1901	1902	1903
Cherries	105¾	244¾	211
Apricots	180¾	222	231¼
Peaches	1892¾	1778	1816¼
Plums	965	1479	1117½
Pears	1529¾	1975	1671½
Grapes	844½	856½	1486¾
Apples	393	238¼	322¼
Assorted	36½	19½	169½
Totals	5948	6813	7032

The San Francisco Chronicle asserts that imported olive oil is not adulterated to any extent till after it reaches this country—that it is the American who does most of the adulteration.

"ITS PENNY WISE"

Policy to set out a good tree, costing good money, and then let the sun burn the bark, or the rabbits gnaw it, when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 450 Santa Fe avenue, Los Angeles.

PERFECT GROWN CITRUS TREES

The cut to the left shows a budded citrus tree as grown in the San Dimas Citrus Nurseries, showing a perfectly shaped head to make a first-class and profitable tree when planted out. It is a one-year-old bud, affording a splendid object lesson of the superior orange and lemon trees we are now offering. Our monograph on "Citrus Culture,"—finely illustrated—tells all about planting and care of orange and lemon trees. If you will write we will be pleased so send you one

DO ALMONDS PAY.

Editor Cultivator: I understand that almonds have paid fair returns at the Pomona station. Will you please tell me if it is so and give some particulars about them?—Subscriber, Ontario.

We can say that certain varieties of almonds have paid more than fair returns at the station during the time they have been old enough to bear, taking them on an average for eight or nine years. For a man who must depend on them for a living from year to year, we cannot recommend them as a reliable crop. For a man who has other resources, we believe the almond is a good thing to plant, provided locations not subject to severe late frosts can be secured. Contrary to the general ideas regarding almonds, water is essential to make fairly regular crops and plump nuts. Even if the rainfall is abundant, a heavy crop of nuts will make late irrigation necessary to properly fill the nuts and force out a good growth of bearing wood. The trees may mature a large crop for almonds of good quality, but if little growth is made you cannot expect a crop the following year which may have the exact conditions for setting another good crop. There are four reasons why summer irrigation is good for almonds and it is profitable where water is not too expensive. It makes a plumper and larger nut, gives the trees a chance to develop plenty of buds for the following year while the trees are still carrying a big crop, makes the fruit buds that are forming, better able to withstand the late spring frosts and increases the growth of the trees, thereby increasing the bearing surface. The general increased vigor of the trees brings about these results.

The above is not all theory, but as far as we can see, are positive results as compared with almond trees in some of our generally recognized almond growing districts where irigation of the almond has not been practiced. We know of almond trees that were planted in these districts; that are less than one-fourth the size of our trees. The former have equally as good conditions except that they have never been irrigated while ours have. The only difference in the con ditions is, that the almond groves in question are planted in solid blocks while we have but a single row which was planted in the center of an orchard, cherries on one side and oranges on the other. We attribute the difference in size to the extra water received by our almond trees during irrigations given to them and to the ad joining trees. Trees that produced from 50 to 100 pounds of nuts each, have made a growth of from six inches to two feet all over the tops of the trees. This would have been impossible on our land, had not the trees been irrigated.

As to the profits, our orchards show that during the yeasr 1896, '97 and '98, our almonds were a total failure. In 1898 an abundant crop was promised and the nuts were mostly over half grown when the thermometer registered 28 degrees on the 23rd of March. All the nuts dropped except a few in the tops of some of the trees. From the time the trees had been planted, four years till the present year, including nine bearing seasons (including the first season that the trees bloomed) the trees have brought in a gross income of $125 per acre, counting 70 trees to the acre. We have figured from prices as they are given in the market quota tions. We have one disadvantage, the fogs that come into the valley at night during the fall just as the nuts are opening, discolor the shells of the almonds, but otherwise, they are as fine as any almonds grown.

It is an object to secure varieties that bloom late. We recommend on this score, Hatch's Seedling No. 2, Languedock, Silver Shell, Lewelling's Prolific and Golden State. Hatch's No. 2 and Routier's Twin bloom nearly a month later than most varieties. The former is a paper shell with single kernels and a very desirable nut, except that it is rather small. Routier's Twin has double kernels and is therefore objectionable as that peculiarity makes ill shaped kernels.

Summing it all up, we can see where a man with a little capital can do well with almonds in the right location. During the nine years which we have taken into our estimates above, there were two years when the crop was totally ruined by frost. Two years the trees did not put out any bloom. This makes but five years in which crops were gathered, the other four years bringing no expense except the regular cultivation of the trees. It costs about $25 per acre to grow and put a crop of almonds in the sack. As with the walnut, the prices are always good and in fact, there have not been the fluctuations in almond prices that are recorded against the walnut. With the exception of prune rust, shot hole fungus and red spider, the almond is so far free from pests. These can be successfully combated by cheap and simple remedies. By the first of April, the grower will know just about what his crop will be.

* * *

A GOOD ALMOND.

Editor Cultivator: Under separate cover I send you a package of almonds that came from trees that were bought from the California Nursery Company in 1892. The trees have borne good crops ever since they came into bearing. Will you please tell me the name of them or tell me to which class they belong?—W. F. Hyde, Banning.

The almonds received look like Languedock except that they are a little smaller. They the without doubt Brier's Languedock. They are a good nut and belong to the soft shell class.

* * *

BLEACHING DRIED APRICOTS.

Editor Cultivator: I have two carloads of last year's dried apricots which have turned dark; what method is necessary to re-bleach them and about what will it cost?—E. A. C., Sespe.

There is no method that is satisfactory that is ready for publication or for practice. Prof. Geo. E. Colby of the Agricultural Department of the State University has worked out a method that bids fair to fill the bill, but it is not ready for use yet except as interested parties wish to work with him in the laboratory on samples. Full particulars can be had by calling on him in his laboratory at Berkeley.

* * *

SUGAR GUMS.

Editor Cultivator: Will you please tell me when is the proper time to plant sugar gum seed (E. Corynocalyx) in boxes so as to have them about six inches high at planting time?—Frank Shirley, Carlsbad.

The seed should be planted about the first or middle of September. Special care should be used in starting this variety as it seems much harder to raise from the seed than most varieties.

BY J. W. MILLS, ONTARIO, CAL.

LATE IRRIGATION OF ORANGE TREES.

It has been our idea that orange trees which have received copious irrigation during the early fall are not so well prepared to withstand severe frosts as those which are only moderately irrigated from then till after the rains set in. This is especially true of young trees that are liable to be injured with frost. A late growth will almost surely be cut back and the branches injured back of where the young growth starts. If young trees can be induced to skip the usual September growth, it will be much better for them. Withholding the water will have a tendency to do this. It requires time for the wood to harden after the fall growth is finished and when the trees grow too late, severe injury is the result in many locations. While we do not advocate allowing trees to suffer, yet we know in practice, that if an orange tree is allowed to show signs of wilting before irrigation time comes around, there is no perceptible injury done the trees. If this is allowed to go too far, however, application of water to a suffering tree will start it into new growth. It has been our experience that orange trees that are irrigated thoroughly and at long intervals, stand freezes better than those that are given a light irrigation each time and often. By a thorough irrigation we mean one that will send the water down three or four feet. This sort of an irrigation cannot be given in 12 hours on most soils.

A RARE CHANCE.

Nell—I was delighted to meet her at a bargain sale today.

Belle—I thought you detested her.

Nell—So I do; and during the crush I found a chance to give her a few good pokes on my own account.—Philadelphia Ledger.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A. B. C. OF INSECTS
(Continued)

We have now considered all the orders on insects that pass through incomplete transformations, and the thrips besides, for although these appear to pass through incomplete transformations, it will be remembered that the pupa is inactive, which is never true of insects typical in this respect. All other insects are complete in their metamorphoses. The larva do not look at all like the mature insects. No one who has been somewhat of a student of insects or who had not been told would ever suspect that the larva just from the egg could be any relation to the parent insect that lays the egg.

* * *

Order, Coleoptera.—In this article, we shall give attention to the great order of beetles. The beetles are very characteristic. No one ought ever to mistake them for the insects of any other order. Yet I often get beetles for identification with the statement that a bug is sent for naming. Only last night I had a little beetle from one of our brightest fruit growers in which he made just this error. It was a "new bug" to him. The distinction between beetle and bug is marked and obvious. All beetles have jaws and bite and have the two pairs of palpi, mentioned when we described mouth parts, well in evidence. We have seen, on the other hand, that bugs have a sucking beak and never jaws for biting. The bug always sucks, the beetle always bites. Again, there are no palpi at all to the mouth parts of the bug. It is easy to see then, that by the use of poison, like Paris Green, we could soon rid ourselves of beetles while such applications are entirely useless fighting bugs.

The wings, also, are quite different. Indeed the wings of beetles are totally unlike those of any other order, though faintly reminding us of the locust and cricket order. The name of this order, Coleoptera, means "sheathed wings", as the functional wings, those used in flight, when at rest are snugly folded beneath two thick wing covers, which are called elytra. These elytra, then, protect the wings or sheath them, and hence the name, Coleoptera. When in repose, as just stated, the true wings are curiously folded beneath the wing cover or elytra. It is passing strange how the beetle can fold these wings so quickly and accurately. They are not only folded lengthwise, as is a fan when is closed up, but are also folded over from the end. I once had a model of a beetle in my possession and I was a long time learning how to fold it. We have, then, the characteristics of the beetles. Sheathed wings, biting or mandibulate mouth parts and complete transformations.

The larvae of beetles are usually called grubs. They are generally long or wormlike in form though in some cases they are considerably shortened. Most of them have three pairs of legs just back of the head, though a few, like the grubs of the snout beetles, or weevils, and some of the borers, are footless. It is while grubs that they do the most damage, though most species take food both as larvae and imago and not infrequently the food is the same in both stages. Thus the larva and imago of the lady bird beetle feed upon scale insects or aphids while the famous potato beetle of the east is a voracious feeder upon the potato leaf both as larva and imago.

Economically, beetles are both friends and enemies. While a great many do neither good nor harm. Some have been famous for many decades as destroyers, to wit, the grain weevil; while others, like the lady birds have long been known as decided friends. We have an example in the Vedalia, which has proved such a boon to Southern California. A large family of black beetles, slow of motion, often seen walking on the ground, are very common here in California,—the Tenebrionides—live upon decaying organic matter like buffalo chips, so we may say do neither good nor harm, except that they do good as scavengers.

The magnitude of this order is somewhat surprising. I think considerably over one hundred thousand are already named and in collections. It is almost as certain that taking the world all in all, the half of them has not yet been discovered. It is probable that there are as many beetles as there are insects of all other orders combined. Indeed I have seen the statement that this order outnumbered all other animals. As we should expect would be the case, where the numbers are so multitudinous, the structural variations and food habits are exceedingly varied.

For convenience in economic study we may divide beetles into two groups, those valuable and those harmful. Of the valuable ones, we can again divide them into those which are predacious, that is, those that feed upon and destroy other insects and those that are commercially important, which include the blister beetles of commerce. The destructive beetles may also be grouped into two divisions, those which feed upon our vegetables, trees and fruits, and those which destroy household goods.

(Continued)

* * *

SMALL LEAF BEETLE.

Mr. John Hoffman of Cucamonga sends me a small yellow beetle—he says "bug"—which he reports as quite common. He asks its name and wishes to know if it is harmful. This is one of the small leaf beetles. It is very common in Southern California and I think throughout the State, as we have it in our collection from as far north as San Francisco. Its name is Glyptina atriventris. As the last name implies, it is black on the under side of the body though yellow in all other parts. All these leaf beetles which are somewhat the shape of lady bird beetles though usually somewhat longer, feed on leaves and so are all harmful. The larvae are either short and thick as in the potato beetle of the East, or long and slender like wire worms in form. Some of them do much damage as grubs, feeding on the roots of plants. One of the worst enemies of the strawberry in the East is of this kind. So far as I know the one sent by Mr. Hoffman does no harm.

* * *

SPOTTED LEMONS.

W. J. Bower, National City, sends some lemons that are quite badly marred with grayish spots. The orchard is not neglected but it is in the best condition. This is another case of the spotted fruit. In this case, it is without doubt wholly due to insect injury. The sun scald does not show at all. This injury from insects seems more common this year than ever before, or else the orchards are watched more carefully. Frequently the sun has added greatly to the damage as indicated by the serious spotting on the sunny side of the tree. Very likely the phenomenally hot weather of October was the cause of this kind of unusual spotting. I think that in a few cases that I have seen fumigation and spraying may have still further deepened the scar.

* * *

BEAUTIFUL APPLES.

I have recently had the pleasure of testing some apples grown by Mr. R. Powell on the Perters and Evans ranch, fourteen miles east of Redlands, at an elevation of 3600 feet, in Yucaipe valley. Some of them, Rome Beauty and Winesap, were remarkably fine. One of them measured some fifteen inches in circumference and weighed 27 ounces. There were others very fine in appearance and flavor of which Mr. Powell wishes to know the name. I will take them to San Diego in hopes to learn the name of which I am not certain. All of the apples are remarkably beautiful. Mr. Powell asks if there is any danger of introducing the wooly aphis into an apple orchard by the simple visits of a fruit tree inspector or of any person examining an affected orchard and then driving directly to one unaffected. I should say that there was no danger in such a case. The wooly aphis is not at all likely to get on a person and the chance of its being carried in such a way would certainly be infinitesimal.

* * *

KATYDID'S EGGS.

Subscriber sends a leaf around the edge of which are some overlapping, brownish scales, sixteen of them, each of which has a little hole through it. He wishes to know whether they are eggs or insects. These are the common katydid's eggs. The little holes show that a chalcid fly has parasitized them. Thus not a single one would have hatched out. These katydids belong to the locust order and though they live on vegetation, they are too rare to do any serious harm. Their scarcity may be due to the little chalcid fly that so generally works upon them.

* * *

ASPARAGUS BLIGHT.

Mr. W. S. Corwin of Highland sends us some asparagus sprigs which are covered with black specks. He asks what the trouble is. I regret to say that this is the very destructive asparagus rust. Before these black spores show on the stems and leaves, the fungus threads or mycelia, have entered the stem and entirely disorganized the plants. These black bodies are the spores which are really the seed that will continue the mischief. This asparagus rust has become a very serious pest in Southern California. Our conditions seem to favor its spread and development. Mr. Smith, a government expert, is now giving his whole time to its study, and we hope he will discover a remedy that will bring relief, but as yet, we know of none. I am happy to state that Mr. Smith thinks that the exceedingly dry atmosphere of the Coachella valley will preclude the spread of this rust in that region. I hope he is right, but I greatly fear that he is not. I advise every one in the valley to be exceedingly careful not to introduce any asparagus from a region where this disease is present. Soaking the seed in bluestone might be tried but if I lived in the Coachella valley I should use every effort that no affected seed be brought in.

* * *

ALLIGATOR PEAR.

George E. Byron, Glendale, desires to know where he can get the alligator pear. My neighbor, Prof. Sumner, secured it of the Park Nursery Company, Pasadena. I think I have also seen it at the Los Angeles nurseries. It should be remembered that this is quite a tender tree. It dropped all its leaves here last winter, after the frost, but they came on again at once and the tree has made a fine growth this summer.

LEMON PEEL SCALE.

Mr. R., Los Angeles, is troubled with the little round white scale, Aspidiotus nerii. He sent me some last spring. It works not only on twig and leaf, but on the lemon and pomelo fruit. It is especially bad on the latter fruit. He feels anxious as it seems to be spreading in his orchard. A chalcid parasite has heretofore held this scale in check. The parasite should be introduced and in case it fails to do the work promptly, distillate spray should be used. As the insect is hatching continually, twice spraying would be necessary to exterminate it.

* * *

EUCALYPTUS.

"Subscriber" is grieved over a row of eucalyptus trees on his neighbor's ranch, very close to his line. He asks if there is any remedy in case his neighbor cannot be persuaded to remove them. I think not. Indeed, I am not sure but that it is better for both him and his neighbor to leave them. The people of Cucamonga have had more experience with these windbreaks than any other section that I know of and they are of one accord in favor of the eucalyptus. Mr. Frank Palmer, on the Richards estate, is one of our experienced orchardists. He does not cut the fine eucalypts that border that estate. He does, however, fertilize and water so generously that the orange trees next to the eucalypts show very little injury from the presence of the large trees. I am not sure but "Subscriber" would be wise to surround his own place with a similar row of gums.

* * *

ATTENDANCE AT CLUBS.

There is a strange and inexplicable apathy on the part of our ranchers regarding the clubs. At our last club meeting at Claremont we had an exceedingly interesting and valuable program. Prof. Baker gave a most valuable talk on humbugs, and Commissioner Pease gave us of his wise and wide experience regarding fighting scale insects. One would suppose in view of the importance of this last matter, every orchardist for miles around would have flocked to this meeting. Yet there were only about forty present where there should have been one hundred and forty. What can be done to arouse the people to a right consideration of their opportunities in this direction? We surely need some pomological Elijah to thunder forth the value and importance of just such schools as these excellent club programs furnish. No wonder our orchards do not reach to perfection. No wonder trees show variegated leaf and that fruit is smutty and does not stand up well in shipment. No wonder the soil is often depleted and that the trees languish for water properly applied. No wonder that some of the ranchers get returns in red ink, while others have pocket books that are swollen to repletion as the returns come in. I am free to say that if our people would rise to the occasion, form clubs in every neighborhood, give them their best thought, study and energy that we could raise the income from our orchards twenty-five per cent in a single year. A comparison of such orchards as that of Teague, Chapman and Leffingwell with the red ink orchards shows at once how tremendously important are these suggestions to our Southern California orchardists.

Coast News and Notes

BY R. A. DAGUE, COR. SUTTER AND SANSOME STS., SAN FRANCISCO

HORTICULTURE.

More than half of the fruit trees of Santa Clara county are prunes.

Orange pickers near Springville, Tulare county, are being paid $1.75 per day.

A great many dried prunes are still held for higher prices in Santa Clara county.

A large force of women and girls are engaged now packing oranges at Exeter, Tulare county.

The Oregon crop of prunes is estimated at 1000 carloads. Prunes bring in New York, about two and three-fourths cents.

The California fruit canners' plant at Santa Rosa, this season, put up 3,672,576 cans of berries, fruits and tomatoes.

A. Flosbach, near Edendale, has ten acres in prunes. Mr. Flosbach raised on these ten acres, 30 tons of dried fruit, worth $2500.

Orange picking is now in full blast in the Lindsay district, Tulare county, and three large packing houses are now busy.

At this writing the California Fruit Distributors have, this season, shipped east 7418 carloads of fruit, as against 4069 on an even date last year.

The Board of Supervisors of Tulare county has abolished the board of horticultural commissioners on the ground that such officers were not necessary.

The realty syndicate, of Oakland, will employ twenty-five men for three months, to plant out cyprus, pine and blue gum trees. They will plant 250,000.

The Tulare Register says the orange growers of that county are complaining that oranges are ripening slowly. A few frosts are needed to hurry up ripening.

Quite recently two carloads of fresh California fruit were sold at auction in New York. One brought $1535 and the other $1328. At the same time, in carload lots, fruit sold in Chicago, on an average of $1300.

H. D. Curtis, of Los Gatos, has shipped this season, at this writing, about 1,600,000 pounds of dried fruits. He says the foreign demands have been heavy. About three-quarters of what he shipped went abroad.

The San Jose Mercury says, a prune orchard near that city, of 100 acres, produced this year 448 tons of green fruit, or 228 tons of dried fruit. The crop sold for more than $15,000. The crop netted the owner $100 per acre.

Los Angeles capitalists have purchased a large tract of land at Geyserville, and will subdivide it into small vineyards. A tourist hotel will be erected and the place made both a summer and winter resort.

Vacaville, this year, shipped 1143 cars of fruit, as against 844 last season. That was an increase of 299 cars. This was the most prosperous season to the growers of that section they ever enjoyed.

It is expected from 300 to 500 fruit men will attend the State Convention of Fruit Growers at Fresno. Governor Pardee and other noted Californians will be present, and many valuable papers on fruit raising will be read.

The Sonoma steamer was the first to carry away a shipment of this year's crop of citrus fruits from San Francisco. She sailed a few days ago for the Antipodes, with 100 tons of lemons, 155 tons of oranges and other merchandise.

Our exporters of prunes are having trouble to get prompt delivery of their goods. In some instances the fruit is on the way 100 and 110 days between New York and Bordeaux, and is wormy and spoiled when it reaches its destination.

John Rock, of the California Nursery, of Niles, says fortunes await the party who will raise the tree which produces cork. Our cork now comes chiefly from Spain and Portugal, but Mr. Rock is certain it can be easily grown in California. He has in his nursery some fine cork trees.

According to the Los Angeles Times the yield of citrus fruits for 1903-4, will be from 25 to 50 per cent greater than last year. The prospective crop is variously estimated at from 28,000 to 35,000 carloads. The weather of December and January will have great influence on the yield.

Prof. Albert Kaebelle, the famous government entomologist, recently came to the United States from Hawaii, to look for a parasite to destroy a pernicious insect that is seriously damaging the sugar cane in Hawaii. He found what he wanted in Ohio, and has shipped to Honolulu 2000 of the bugs.

Lieut. Governor Alden Anderson, manager of the California Fruit Distributors, at Sacramento, says prices for dried fruit are too low, but we shall see a great improvement during the first of the year. This year's crop of prunes and peaches are only 60 per cent and apricots and pears are only 30 per cent of last year's crop. The carry-over stock has been sold; hence, prices of dried fruits must soon advance.

Mr. Van Gelder, a prominent orchardist of Acampo, who handles dried fruits extensively, said to a representative of the Cultivator that, notwithstanding newspaper reports about the prosperity of the California fruit growers, yet this year dried fruits are ridiculously cheap. He has urged that growers co-operate, build a common ware house, grade their fruit and hold it till they can sell at a remunerative price. "But," said he, "the average farmer is the last man to comprehend the advantages of co-operation."

Samuel Johnstone, of San Francisco, recently took several trips into the country in different directions. He found great quantities of apples rotting on the ground, and grapes unpicked. The apple growers said: "The box combine has raised the price of boxes so high and the commission men cut us so deep we cannot market our fruit." The grape growers said: "The wine combine want all the profit, so it does not pay us to pick and haul the fruit." And yet, the consumers in this city are charged from 4 to 10 cents per pound for apples, and grapes at from $60 to $120 per ton.

LIVE STOCK.

The Napa Journal is authority for the statement that a Petaluma poultry raiser has succeeded in breeding a featherless fowl.

The cattle quarantine in force in Monterey county, will be declared off the beginning of 1904, by order of State Veterinarian C. H. Blemer.

Millard Saunders, trainer of Lou Dillon, has changed his intention. He will take the mare to Memphis, Tenn., to winter instead of Santa Rosa.

A "turkey train" carrying 20,000 dressed turkeys weighing ten tons, was run into San Francisco from the Sacramento valley to supply the demand for those fowls for Thanksgiving.

Henry W. Lawrence, of San Francisco, has asked the State University to assist him in introducing in this state new food for sheep. The shrub is known as "ceanothus integgerrimus."

The late winds rattled the berries from the umbrella trees on the farm of A. E. Becker, near Wasco. They were eaten by his hogs, six of which died in a few hours. On opening the dead swine, the berries were found in indigestible wads.

Judge B. F. Emery, of Santa Rosa, representing the poultry association of

Coast News and Notes

CONTINUED

Sonoma county, spent a few days recently in San Francisco and Oakland, investigating the egg business. He found that retailers of those cities were getting 50 to 60 cents per dozen, while poultry men of his county received but 38 and 40 cents.

MISCELLANEOUS.

A Farmers' Institute will be held at Tulare Dec. 2nd and 3rd.

Santa Rosa and Petaluma will be connected by an electric railroad.

L. A. Walker, of Tulare county, extracted 500 pounds of honey this season, from three stands of bees.

The Santa Fe has just received an addition to their rolling stock; 26 new Pullman cars, to run between California and Chicago.

The Board of Supervisors of Santa Clara county has purchased fifteen standard voting machines, to be delivered March 1, 1904.

The contract has been let for the steel rails with which to construct the Bakersfield, Santa Paula, Ventura and Hueneme railway.

The St. Helena Star has had presented to it a chysanthemum plant, two stems of which are eleven feet long, crowned by immense blossoms.

A well attended mass meeting of farmers and business men was held at Gridley the 14th, to discuss the subject of irrigation.

The Methodists, at their quarterly conference held last week, at Napa, by resolution, denounced the wine business in that county, as "a curse to the valley and a foe to the church."

The latest report of President Harriman shows that the total gross receipts of the Southern Pacific Company from July 1 to Oct. 1, this year, was $23,840,062, or nearly $8,000,000 per month.

Up to this time the law passed by the last California legislature to provide that a free market should be maintained on State property in San Francisco, has been disregarded.

Minnesota has 681 creameries. They turn out 75,000,000 pounds of butter yearly, which sells for $17,500,000. The creameries use the milk of 420,000 cows.

The San Jose scale has been discovered in American apples sent to Germany, and the authorities are taking steps to prevent its spread in that country.

The Southern Pacific Co. is figuring on the proposition to join an equipment company with a capital of $5,000,000, to buy up all the refrigerator cars and other special freight cars, and if the private owners decline to sell to build their own. About 1300 private freight cars are now engaged in hauling freight to and from California.

AGRICULTURE.

So far, about 40 carloads of walnuts have this season been shipped out of the Fullerton district.

Orders for seeds from the East are pouring into Santa Clara and heavy shipments are being made.

California annually produces 10,165,000 pounds of hops. So far, Alamena county raises the finest grown in the state.

A. L. Martinelli, of Napa county, gathered eleven tons of tomatoes on his place this year and sold them at from eight to ten dollars per ton.

Dr. G. W. Shaw, of the agricultural department of the State University, asserts that beet sugar is just as good for canning and preserving fruits as sugar made from cane.

Charles Von Graffen, of Sonoma, raised this year on new ground, a fine crop of potatoes. Some of them measured 12 inches in length and five inches in circumference.

Much loss of life is reported in northern Georgia, due to eating cabbage with a small, poisonous worm in it. It is something new to the experts who have examined it.

Forty square miles of vineyard lands in Fresno county are to be underdrained by laying down tiles. It will cost the owners $250,000, and bonds will be issued to raise the necessary money.

There will be a conference between the grape growers and the wine manufacturers, at Healdsburg, Nov. 27. The wine men are proposing that the growers contract to deliver grapes for the next three years to the wine men at $20 per ton.

The U. S. Department of Agriculture, in an official report for November, states that the indications are that the world will, this season, produce 4,342,800 tons of cane sugar, and 6,083,000 tons of beet sugar. Total, 10,425,800 tons.

Geo. C. Husmann, U. S. Viticulturist, sent to California to establish experiment stations, has established nine at points heretofore mentioned is the Cultivato.r At Cucamonga especial tests will be made to ascertain what can be successfully grown under desert conditions.

Alexander McAdie makes the following summary of the weather and crops for the week ending November 23:

The weather during the week was clear and warm in the south, and generally cloudy and warm in the northern and central portions. Generous rains fell over the north and central portions, and light showers in the southern portions of the San Joaquin valley and south coast district. The rainfall from San Francisco Bay northward averaged from two to three inches. Fogs occurred along the central coast. Heavy frosts occurred in some districts on the 16th, but caused no damage.

The soil in the Sacramento valley, the Bay section and northern portion of the San Joaquin valley is in excellent condition, and rapid progress will be made in plowing and seeding. In the north coast section the ground is in many places too wet for plowing. The seasonal precipitation in the central and northern portions of the state is nearly normal, but in the southern portion of the San Joaquin valley, the south coast sections and Southern California it is below the normal. All summer crops are under cover. Early sown grain is coming up, and green feed will soon be abundant in the northern portion of the state.

Southern California oranges are in good condition and promise a fine, large crop. In the Sacramento and San Joaquin valley districts oranges are ripening rapidly and shipments continue. The yield and quality are reported excellent. Olives are doing well. Dried fruits are being shipped to the packing houses in large quantities. The last carload of walnuts was shipped from Anaheim on the 19th.

The Chamber of Commerce of Los Angeles will send to the St. Louis Fair 41 books weighing two tons. These books contain the names of several hundred thousand visitors who registered in the books.

Fruit Growers' Convention.

Programme of the Twenty-ninth California State Fruit Growers' Convention, at Fresno, December 8th to 11th, 1903, under the auspices of the State Horticultural Commission.

Tuesday, December 8th, 9:30 A. M.—Address of Welcome, L. O. Stephens, Mayor of Fresno; Address, Governor Geo. C. Pardee; Opening Address, Hon. Elwood Cooper; The Farmer as a Taxpayer, Hon. John Tuohy; Discussion.

Tuesday Afternoon, 1:30 o'clock.—Transportation and Marketing.—Fruit Markets and Marketing, M. V. Hartranft; What the Post-Offices Might Do for the Fruit Grower, Edwd. Berwick; The St. Louis Exposition, J. A. Filcher; Report of the Committee on Transportation, R. D. Stephens, Chmn; Discussion.

Tuesday Evening, 7:30 o'clock.—Co-operation.—Address, A. H. Naftzger; The Work of the California Fruit Distributors, Hon. Alden Anderson; Co-operation in the Marketing of Cured Fruits, M. Theo. Kearney; Possible and Impossible Cooperation, A. R. Sprague; Co-operation, C. D. Harvey; "The Pact", a protective Organization, Martin Aostoneel.

Wednesday, Dec. 9th, 9:30 A. M.—Raisins and Wine Grapes.—Address, Hon. Chester H. Rowell; The California Vine Disease, Prof. Newton B. Pierce; The Wine Industry and Its Future Prospects, Percy T. Morgan; The Raisin Outlook, Address, T. C. White; The Raisin Grape, Commercially, W. M. Griffen; Discussion.

Wednesday Afternoon.—Trip around Fresno on the cars of the San Joaquin Power and Electric Company.

Wednesday Evening, 7:30 o'clock.—Raisin and Wine Grapes, continued.—The Raisin Grape, Robert Root; Improvements in the Bench Grafting of Resistant Stock, Prof. E. H. Twight; Handling and Marketing the Raisin Crop, D. Dallison; The Growers' Co-operative Agency, A. T. J. Reynolds; Discussion.

Thursday, Dec. 10th, 9:30 A. M.—Insect Pests and Tree Diseases.—Enlarged Scope of the Agricultural Department of the University, Prof. Benjamin Ide Wheeler; Friendly Insects, Alex. Craw; Insects of the Year, Edwd. M. Ehrhorn; Our Scale Pests, Prof. A. J. Cook; New Observations on the Codlin Moth, Prof. C. W. Wentworth; Spraying Operations in the Pajaro Valley, Prof. Warren T. Clarke; Discussion.

Thursday Afternoon, 1:30 o'clock.—Ladies' Session.—Training the Children in Rural Improvement Ideas, Mrs. A. Harris; the Flower Garden, Mrs. Frank E. Cook; The Country Cemetery, Mrs. May S. McNulty; Ranch Labor, Field and House, Mrs. Maud Akin; Good Roads, Mrs. Laura Rhea; Cooperation and Organization, Mrs. E. Shafter-Howard; Poultry, Miss Gertrude Wilson; Discussion.

Thursday Evening, 7:30 o'clock.—Reception at Armory Hall tendered to the delegates of the Convention by the Ladies' Parlor Lecture Club.

Friday, Dec. 11th, 9:30 A. M.—Extension and Improvement of Horticulture.—Needed Horticultural Legislation. Hon. A. M. Drew; Future of the Fig Industry in California, Geo. C. Roeding; The Walnut and its Commercial Prospects, Frank E. Kellogg; Citrus Fruits in the Northern Counties, Major C. J. Berry; Report of the Committee on Labor, H. P. Stabler, Chairman; Discussion.

Friday Afternoon, 1:30 o'clock.—The Fruit Grower and Orchard Help, H. P. Stabler; How Shall We Preserve the Fertility of Our Orchards, A. D. Bishop; Fertilization, Prof. S. M. Woodbridge; Discussion.

The Watsonville Pajaronian says the apple crop in that valley has been marketed much faster this fall than usual and the season is rapidly drawing to a close. About two more weeks will clean out the packing house stocks pretty well, but scattering shipments will be made from time to time for several weeks yet. The shipments of fruit from Pajaro valley this season will be considerably heavier than in 1902, and prices have been very satisfactory to the orchardists.

C. H. SESSIONS, ASSOCIATE EDITOR

MILK FEVER.

I noted the remarks of your veterinary editor in the last Cultivator, on milk fever. I have decided ideas of my own on that subject. It may seem like assurance to offer them to your readers. But I have been a student of physiology and more or less of pathology all my life, and I have had a very wide experience with cattle. My father had a first class milk herd in the care of which I had my apprenticeship. I thus formed early, a fondness for cattle and the care of them, and became, almost from my very childhood, a careful student of cattle. My father's herd were fine milkers, he was a good feeder and I hardly need say that milk fever was not rare in our herd. As soon as I commenced life for myself, I longed for a farm and cattle. I soon had both and from that day to this, have never been without cattle worthy of the blue ribbon. I, like my father, would only have the best; like him, I am also a good feeder. I have had two serious cases of milk fever. I believe I know the cause of this dread disease. I do not accept Schmidt's theory. If the cause was poisonous milk, would it not be the calf rather than the cow that would suffer?

This is my view. Parturition is a strain upon the cow as upon all the higher animals. The springing of the milk just after parturition is another thing which must come with a severe shock. If the cow is a great milker, giving, as cows often do, fifty pounds of milk a day, then this shock must always come with menace. Again, the good feeder, full of kindness for his cow, not knowing of the danger, gives liberal feed and abundance of water, possibly very cold, just after this trying ordeal has past. This calls for great energy of digestion, enduces greater milk flow, and hence the third threat of evil. The poor cow could stand, one, possibly two of these strains upon her vitality, but the three are too much and she goes down with the terrible puerperal fever. In case a cow is a great milker, there is always danger. We can only work to minimize it. Parturition can be made easier by having the cow in good heart as the time comes. Thus, while I would not over-feed, I would certainly not have the cow losing in strength at this time. As soon as symptoms of calving appear, I would largely shut off the feed, and give water sparingly and that, not cold. A little bran mash and a handful of good hay is enough. Prolong this fast for two or three days, until the danger is over. Milk fever will usually come the second day, and almost always within three days, so far as I have observed. This fasting make little call upon the digestive energy and in not stimulating milk flow, prevents against shock from that cause. I believe that in following out these suggestions, milk fever will rarely threaten even the best cows. We know that prolonged labor, not infrequently results in puerperal fever in our own kind. We see the same reasoning will account for this. In the two cases of milk fever which visited me, explanation is easy on the above hypothesis. I am happy to say that both my cows recovered, although both were terribly sick.—A. J. Cook.

POINTS OF A GOOD HORSE.

The muscular fiber must be fine and dense, with well-rounded development in every way.

The size of horses does not indicate strength and constitution. Quality throughout and firmness of bone are more important than size.

A horse with oblique parterns is less liable to concussion and lameness in the joints of the legs. The body must be well-rounded but deep, not flat ribbed.

SAN FRANCISCO PORTLAND

Address all communications to DR. H. D. FENIMORE, Veterinary Surgeon, 642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

HORSES THIN IN FLESH.

Editor Cultivator.—Can you tell me why I can not fatten my horses. I feed them heavily of rolled barley and barley hay, but they will not get flesh. What is the reason?—H. W. Hager.

The discription given is not sufficient to make diagnosis from.

* * *

WIND SUCKER.

Editor Cultivator.—I have a horse eight years old that sucks wind. He opens his mouth, throws back his head and gulps in wind. He does not take hold of things as a horse does with cribs. Please state the cause of this act and the treatment to stop it.

This is a habit that is very difficult to break in the horse. Some people use a strap around the neck, tight enough to prevent the horse from extending the muscle of the neck sufficient to perform the act.

The state dairy and fruit commissions of Pennsylvania prosecuted 621 violators of the pure food laws of that state during October last. There is a golden opportunity for that sort of work right here in California.

If one thinks he knows it all he is in a fair way to be called dull.

MINNEWAWA STOCK FARM

Offers For Sale TWO HOLSTEIN BULLS Now in Use in Herd

LEGAL TENDER BLANCO, 26943
Mostly black. Dropped January 1, 1900
SIRE—Nero Blanco, 25002. His eldest daughter, Eva Blanco, 2 years old, has an official record of 14 lbs.. 5 oz. in 7 days.
DAM—Legal Tender, 42315. Private record of 379 lbs. of butter in a year.

SIMONDA DE KOL
Registry applied for. Dropped Nov. 12, 1900. White with black tips to ears and small spots.
SIRE—Ignaro De Kol, 23533. Sire, Johanna 5th, Paul De Kol. Dam, Cascade Princess, official record 17 lbs. in 7 days.
DAM—Mamie Clifden Judith, 43191. Private record of 7½ lbs. in 30 days. Average test, 4.2.

Importing Fancy Stock.

One of the favorable signs of continued confidence in the good times we are enjoying, is to be found in the effort farmers and dairymen are making to secure imported stock. A farmer from near Pomona, told us this week, of his purchase of a pure blood Jersey bull to head his herd of young stock which is about three-fourths grade.

Another farmer tells us he has ordered from the East a thoroughbred Chester White boar, from which he expects to breed up a choice herd of sows.

These are good indications of the interest being felt in Calfornia to advance the grade of stock.

As has frequently been said in the Cultivator's columns, there is no economy in keeping low grade stock. There isn't any satisfaction in the business, in the first place, and in the second place it costs as much to keep a scrub as a pure blood. Then when a farmer comes to sell his stock he realizes the importance of possessing fine stock in preference to the common kind. The Cultivator would be glad to see every farmer in this state possess himself of a pure blood animal or two, because, we know, that in a comparatively brief period, the country will be well on its way toward an entirely different breed of cattle and hogs from that found on our farms today.

NEW AND DANGEROUS DISEASE.

About a year ago a very dangerous disease broke out on the Minnesota Experimental Farm, which has since proved a dangerous and very ugly thing to handle. It has spread out in the state and over into Iowa, and is causing distress among cattle men generally, in the two mentioned states. The cattle act as though they were suffering from cerebro-spinal meningitis. Dr. Reynolds, in Bulletin No. 82, of the Minnesota experiment station, calls that disease Haemorrhagic Septicalmia, and states that this name probably covers a number of diseases produced by the same or similar germs.

In regard to the symptoms, Dr. Reynolds, in Bulletin No. 82, says:

"As a rule the disease appears suddenly; the case develops very rapidly and terminates fatally. The antimortem symptoms are very unsatisfactory from a diagnostic standpoint. The postmortem symptoms are definite and as a rule easily recognized and consist of more or less extensive hemorrhages, which are sharply defined when they appear upon the surfaces of the vicera and serous membranes."

While no known remedy is at present at hand for this disease, it is hoped that new light has been obtained of which use may be made in the future.

THE PAYING DAIRY COW.

There are two great principles in dairying that must be strictly adhered to, or failure is sure to follow. First, we must have a cow suitable for our business and, second—and of no less importance, great attention should be paid to her feed and care. We may have the best of cows, but without proper feed and attention, failure is sure to follow, while with poor and inferior stock, no amount of feed and care will return any profit.

The paying dairy cow is the one that makes money for you, and unless you have a choice of breeds, it matters not whether she be a Jersey, producing milk of high quality, or a Holstein, of large quantity, or a high grade of any other breed, so long as she gives a large return above the cost of her keeping, she is a good dairy cow.—The Cotton Bale.

A NEW MILK PRODUCT.

Galalith is the name of a new substance made from skimmed milk by treating the casein with metallic salts and soaps, and finally, with formaldehyde. It is as hard as celluloid, takes a fine polish, is odorless and is less inflamable than the gun cotton and camphor combination. At the recent Hygienic Milk Supply exposition in Hamburg there were shown toilet articles, chess figures and even tables made of the new substance. These had the appearance of marble, as galalith takes kindly to various coloring processes, but were far lighter in weight. As an article of commerce it is destined, so its sponsors believe, to become widely used and correspondingly reasonable in cost.

CHEESE MAKING ON THE FARM.

Dairying is considered today one of the most prosperous and highly developed forms of farming, and no branch of agriculture has made greater progress during the last generation. In 1860 the price of cheese was 10 cents a pound, and farmers were afraid to engage in such an industry, believing over-production would result. In 1850 cheese exports were 10,000,000 pounds. Present cheese exports are not large owing to the foreign market having been ruined through the shipment of "filled" cheese by unscrupulous exporters; but the annual production and consumption of cheese, as are likewise those of butter and milk, are constantly increasing.—Tennessee Farmer.

THE CREAM SEPARATOR.

The cream separator is the up-to-date means of separating cream from milk, doing quickly, cheaply and perfectly what is otherwise done with much labor and trouble, and more or less imperfectly in the various older ways.

The perfect cream separator is an extremely well constructed piece of machinery and its operation is simplicity itself. This work is done as soon as possible after milking, the process is continuous. The principle is centrifugal force, produced by very rapid revolution of the separating vessel.

The advantages of the cream separator over older methods have come to be well known to almost every one keeping cows or separating cream from milk. But many have yet to learn the full extent of the dollars-and-cents benefits of a separator in their own individual case.

First of all, with the perfect cream separator comes the complete separation and recovery of all the fat in the milk, which is not possible in any other way. From 10 per cent. to 50 per cent. goes to waste by all setting or dilution methods.

Then, as the separation takes place soon after milking, the cream is sweet, of even thickness, without taint or odor, and it may be churned into a butter worth from 2 to 10c more per pound.

Then there is the sweet, fresh, skim-milk for stock and other feeding purposes, worth much more than the milk skimmed in the old way, which is frequently more harmful than nutritious.

Then, there is the saving of setting and handling of milk in the old way, of skimming, of ice and water and warming of skim-milk, and of all the work and endless drudgery which the old way involves for everyone.

All this means time and money, better product and more of it, with less work and less trouble. Thousands of tests prove it to mean an average of at least $10 per cow every year. It is easy to figure what that may mean to you.—DeLaval Magazine.

DECLINING CATTLE BUSINESS.

The Cultivator is pained to learn of the failure of Mr. Sotham, for many years a leading breeder of White-faced cattle in the Middle-West. Mr. Sotham is an example of the men who have been plunging in the fine stock business for the past six years.

The failures of cattle breeders in the past three months, have been frequent, and their losses heavy; so much so as to set people thinking and asking the question, "What's the matter with the fine stock business?" There is nothing the matter with the business, as a business, but there is a good deal the matter with men who have purchased extremely high priced cattle on a falling market. We know breeders who have paid $2000 for a yearling calf which was not worth more than $250, and the get of which would not bring more than $200.

That was not business, still it was frequently done. The result has been, where breeders "plunged," overbought, and bought without discretion they have failed. What else could be expected? The same rule will apply everywhere in business. It certainly will not make an exception of the cattle business. Another thing will have to be done, owners of fine stock will have to get down where buyers can pay reasonable prices for their stuff. Prices have been exorbitant in some lines of fine stock, and the result has been that buyers have been frightened and would not buy even though they needed stock.

Discussing Mr. Sotham's failure, Farm, Stock and Home, makes a good point where it says that "the business of breeding fine stock has became burdensome from watered stock—over inflated prices."

"A purely fictitious value has been put upon live stock as upon paper stock, and in the last analysis disaster must result. A thousand or two dollars for a yearling calf is as glaring an example of stock-watering as Morgan was ever guilty of. The consumer of the products of an over-capitalized factory cannot afford to pay a price for them that will guarantee interest and dividends on the fictitious capital. Nor can the ordinary breeder of cattle afford to pay a price for fancy specimens that will pay interest and dividends on the woefully inflated values of whole herds of "pure breds." The fashion of putting prices on animals

We make it a rule of the Lemonita Herd to raise no bull calf from a dam which has not made a record of 400 pounds of butter in a year. The dam of this calf being just fresh for the first time, we can form no idea of her merits as a performer; but the calf's pedigree is so exceptional that we dislike to kill it, and will sell it cheap to someone who will raise it and take his chances on its turning out well. The dam is rugged and hearty and promises well; the sire is the best proven sire in Southern California. This calf is reasonably sure to be good enough to grade up any average dairy herd, and should not be sacrificed. For price address C. W. LEFFINGWELL, JR., WHITTIER, CAL.

out of all proportion to cost of production or utility in the breeding pen is a bad one, and the sooner it "goes out," the better for all cattlemen.

The direct burden this fashion imposes upon extensive breeders and dealers, like Mr. Sotham, is in the form of an enormous capital, that in almost every case must be borrowed, largely, and thus adds an immense interest account to a business that is not remunerative enough to stand the strain. A thousand dollar loan on an animal that the ordinary farmer breeder cannot afford to pay more than $250 for, will very soon devour the animal, leaving its owner nothing but his debt.

Another cause of failure is the tremendous cost of keeping up these destructive fictitious values. Breeders buying from each other, or assuming to, at absurdly high prices, relatively to intrinsic value for the sole purpose of making less costly, but still absurdly high-priced animals seem cheap to the farmer breeder, is an expensive, unworthy and illegitimate practice, that will inevitably react. The blooded cattle business must be reformed as to methods, and the failures of those extensively engaged in it demonstrates the necessity of reform, and it can't come too quickly for the good of the cattle industry in general."

Again we say, there is nothing wrong with the cattle business, it is a legitimate and profitable one, if conducted on sound principles, but like all other kinds of business, it will not stand "plunging," nor over inflation.

COST OF CATTLE DECLINE.

A Texas authority, said to be conservative and reliable, estimates the shirkage in the value of beef cattle in that state during the year to be $21,000,000, at the very least. The other states and territories—New Mexico, Arizona, the Dakotas, Kansas, Nebraska, Nevada, Wyoming, Colorado and Idaho—with their enormous range areas and myriads of cattle, are also victims of the decline, and their losses added to that of Texas, and all the other states with their smaller but more numerous operators, make a grand total that would be dizzying if it could be comprehended. But a little thing like this does not change the tune of the universal and unparalleled prosperity tooters, nor move them to ring down the curtain on the play that has been a farce to millions of people from the beginning.—Farm and Home.

The decline in the price of cattle should not discourage farmers, nor dissuade them from buying, in reasonable quantities, pure bred stock —especially male animals to head their herds. It is no criterion to judge the cattle business by, to see men who have plunged, go to the bottom. It is simply leveling conditions.

Some farmers keep their barns in such a filthy condition that it is surprising to see how they can produce cream and make butter that will bring any price. This is the cause of the low price of some butter, cream and cheese. The customers want quality instead of quantity, and they are willing to pay a fancy price for a good article.—A. A. Eastman.

FEEDING HOGS.

Nothing has yet been found which fills the bill so well as a ration of which the basis is skimmilk in conjunction with finely-ground oats or barley and shorts. All these are flesh formers, says Up-to-Date Farming. Barley is a fat former. A very satisfactory mixture consists of finely ground oats 5 parts, finely ground barley 2 parts, shorts 2 parts, and oil meal 1 part.

Provide private runs for the pigs, in which place a shallow trough containing a gruel made of skimmilk or buttermilk and the meal mixture. Start with shorts, adding the coarser meals as the pigs become older. No grain should be fed until the pigs are three months old. By this treatment, coupled with plenty of exercise, they develop good, healthy frames.

In weaning the common method is to shut the pigs up and let the sows go out in the pasture. Then the music begins. Better have a feeding floor adjoining the hog house. The feeding can be done here. Shut the sows in on this floor and allow the pigs every access to them. Feed the sows all the oats they can eat; give them all the water they can drink. The pigs are fed all they can eat. They go in and can get to the sows. By the end of a week the sows will be dry, and the pigs so disgusted going in and finding nothing that they'll just quit. You will find by the end of the week not a pig will go near its mother. You can turn the sows right out to pasture with the pigs and there is no more trouble. This is not a theory, for it is a very easy thing to dry a sow by feeding nothing but oats on a dry floor, and letting her have plenty of water.

MORE SHEEP NEEDED.

The Iown Homestead dciessussNs The Iown Homestead idscusses intelligently, we think, the question why more sheep will not prove beneficial to the farmer. The points made by the Homestead will not only apply to the states of the middle-west but to all states where ranges exist and where sheep can be raised at moderate cost. We quote:

"There are fewer sheep in the United States today, when compared to the population, than there were 50 years ago. In 1850 there were .94 sheep per capita and in 1900 there were only .52. While this is the exact situation, it does not tell all of it. Fifty years ago there were but few sheep exported into other countries and great numbers of them were kept for their fleeces and they would be counted by the census officer, whereas in later years the sheep are soon made for the shambles and are turned into market for meat. Fifty years ago the large sheep ranches of Australia and South America had not been started to supply the demand for sheep products as now.

We did not start out to prove anything by this lack in increase of sheep in proportion to the population, but we thought it might be a help to understand the situation and answer the question, "Why not more sheep?" In passing along over the country one will sometimes travel miles without having the privilege of seeing a flock of sheep. If there can be any good reason why farms should be lacking in sheep we would be pleased to know what it is. We have been studying the problem for many years and we seem to be no nearer a solution now than we were 40 years ago.

"The man who keeps sheep finds them profitable, the packer is interested in a good grade of sheep and the better the grade the greater interest he takes in his business. The consumer of mutton also has an interest in the business, for he knows a good cut of mutton when it is put before him. The wearer of woolens is also very much interested in sheep, since he would much rather wear wool than shoddy and especially when he pays "all wool prices" for clothing.

"Sheep have been the salvation of England where the land is far more valuable than in this conutry, and yet there are those in this country who feel that the land is too high in price to admit of the sheep industry entering into the plan of management. It is there where the animals with the golden hoof pays the rent.

"Let us study the problem from a profitable standpoint and see why there are not more sheep. The chief reason why there are so few sheep is because people are not educated in their management. With so many it is "Like father like son." If the father kept sheep the son is liable to follow. If he has not kept them the son is liable to not know anything about the business and will probably not go much out of his way to ascertain what there is in the industry. This is a poor excuse for a man who is intelligent. Intelligence speaks out loud and indicates the way one should go to make his vocation profitable and helpful. A look at the situation when compared with present prices of sheep products ought to be convincing to any man who will take the time to give the matter a little study. There are but few farms where the farmer would not be better off by having on them a few sheep. Now and tehn there will be a failure, but there are fewer failures in this line than then there will be a failure, but there of the sheep require a peculiar management and one has to gain a knowledge of this method and have a liking for the business.

GREEN BONE AND POULTRY PROFITS.

My experience with cut bone as a food for fowls extends over two years only with a flock of 100 hens. Prior to that time I had not used cut bone and my article is based on the percentage of gain in the growth, health, and eggs of fowls over the two years previous, when I did not use bone; all other conditions for the four years being about the same.

My attention being called to the value of fresh cut green bone as a food for poultry, regularly twice a week I tried crushed hog bones as best I could and fed it to layers. The result was so satisfactory I bought a small bone cutter and began to feed green cut bone to my poultry regularly twice a week. I tried all sorts of bones and have found the hog and beef bones the best, being easier obtained and containing more of the nutritive value.

I get a soup bone of the butcher, shave off the meat (a little meat won't hurt if you intend feeding as soon as cut) and I feed the same day it is cut.

Some people make the mistake of using bones that have been boiled or lain out and sun bleached. Some of the most essential feeding value of the bone has thus been lost, especially as feed for growing chicks. The animal, as well as the mineral, qualities on the bone are what make it valuable. I experimented with cut chicken bone a little and fancied I saw an improvement over the other bone, but I am not sure, and even though there be, it is not convenient to get green chicken bone. Be sure that the bones used are not those of animals that have died of disease, old age or starvation. The former two are dangerous to the health of fowls, the latter worthless. Bones of young animals are best.

For growing chickens, after two weeks old, I mix the bone meal with corn chops, dampened with curd milk (water will do), so that each bird gets from half to one teaspoonful of the bone meal, according to age.

It is an excellent bone food for the fowl and general invigorator and growth forcer.

Extra large and quick growth bone in fowls means more meat, and more meat means 7 to 10 cents per pound.

For laying hens, I feed mixed as above so that each hen gets one tablespoonful twice or three times a week, according as I think they may need an extra allowance. They need more when they are laying regularly or molting.

The results of the bone as a feed are seen in a very few days in the renewed vigor, health and appetite, and last, but not least, egg product.

Taking every advantage gained by feeding bone—i. e., general health of flock, quick growth of broilers, increase in amount of eggs, etc., over the two years bone was fed, I figure it—and I keep close accounts—that the profit derived is 15 per cent over the profits of the two preceding years. This 15 per cent is attributed to the bone feed and the other increase in profits was credited to the source from which they came.

Now, don't feed an overdose at first, or at any time for that matter; feed regularly.

Don't expect the hens to lay two eggs daily and the young chicks to spring up in one night like mushrooms when they are fed bone. Mix well with the other food so that each bird gets its proportionate share.

Don't expect to feed bone only. The bone is only an additional feed, a sort of tonic.

Now, I am not going into details to explain how the bone assists—could not if I wanted to—only to say that the component parts of all meat bones are the same, and the mineral part of the bone may be found in egg shells. Bone and shells must be supplied from what the fowl eats; hence we feed it to them, directly in the shape of cut bone, instead of indirectly in the shape of corn, oats, etc.

If you once give fresh cut green bone a trial as a food for fowls you will never discontinue it.—W. F. Adams, in Farmers' Voice.

STARTING THE POULTRY BUSINESS.

Many persons are of the opinion that the poultry business is one that requires a mediocre sort of ability; that it is a tinkering, sputtering, old-womanish kind of a business. Many a man who has started in the business by investing considerable capital at the outset has had the above idea suddenly dispelled from his mind. The keeping of poultry is a business that may be started on a very small capital, but even though the beginning is small if any success is attained there must be some special knowledge brought to bear in the care of the fowls from the start or failure will be the outcome. A man must have some special knowledge to choose proper quarters even for a few fowls. If this is not done an endless amount of trouble is apt to follow. If buildings small or large are erected here again some special knowledge is necessary. At every step it will be found to be an occupation requiring a high form of technical skill if satisfactory financial results follow.

We would advise no one to go into the raising of poultry extensively at the outset. Buy a few good fowls and at the same time begin posting yourself on the subject by reading extensively. Study closely the habits of the fowls themselves so as to find out the environment that is most congenial, the food that is best adapted to their needs and the care they require generally. Remember that the poultry business is one of head work as well as work of the hand. Where one has a strong liking for the business and chooses to make this line of effort his life work it is often advisable to pick up the first experience by hiring out to one who is known as being a successful poultryman. Where large numbers are dealt with one would pick up information rather more quickly than where the numbers are small, hence the advantage of learning the fundamental principles in a manner that involves no one in loss.

The statement has been made by a prominent financier that no man ever made a marked success in life who was content to work but seven or eight hours each day. Not but what he thought that this number of hours of one kind of work was sufficient, but that a man who wished to achieve success must in addition exert himself by way of improving his mind or otherwise outside the hours of regular work. This is particularly true in poultry if one expects to achieve any degree of success. They need attention early, late and all the time.—Iowa Homestead.

LAYING EGGS.

If you expect to make money from eggs, you must understand how to manage your hens. You must have your chicken house so arranged that your hens are under your control and then take good care of them. You must encourage them to lay at the time of year when eggs bring the best price, and keep them from laying when the price is low. That is business. Farmers' wives do not generally run the poultry business in that way, however. It can be done and it pays well to do it. Start with a few and see what success you have. If you can do it, branch out and increase your flock another year.

When eggs are cheap, put your hens on half ration for about two weeks, then they will cease to lay. Next, put them on good feed. Sunflower seed and corn makes a good feed, or better still, wheat and sunflower seed. This starts them molting. Feed them this way for about two weeks, then they will begin to shed their plumage, and by the time your neighbors' hens stop laying yours will have rested and be ready to begin laying in earnest again and keep it up all winter, while prices are right. Do not keep all of your old hens. Sell off about half of them each year and let good pullets take their places. The egs from old hens are larger than those from pullets, but the latter are better layers, and you are after numbers more than size. When feeding your hens, be careful not to feed them anything that will taint your eggs, for eggs absorb odors about as rapidly as does milk. When you prepare your eggs for market, see to it that they are packed with care; have them uniform in size and color. Look for customers who can afford to pay a fancy price, and give them a fancy article. That is the way to make money out of your hens.—Tribune.

In looking over the markets in this city, the wonder is not that some of the poultry brings such a low price, but the wonder is that such old, scrawny hens, and poor, coarse roosters, can be sold at any price.

A lucky man his wealth displays
And tells you how he made it.
The hen admires the China egg
And really thinks she laid it.—Successful Farming.

Brooder Chicks.

One of our correspondents asks what to do for brooder chicks when they no longer require heat, will it give them cold to open the lid of the brooder to give air and ventilation, leaving it open half an inch. This was one of my hardest problems and I am not sure that I have solved it yet. I found that leaving the lid open a little was dangerous it made a narrow draught that would cut like a knife and in the human family in this climate, mind, I say in this climate, it would surely bring on an attack of neuralgia or earache, which in chickens would be "swell head" or roup. It would be a better plan to leave the lid wide open if your brooder is in a house, but then you say the chicks would be out and all over the place in the morning. The next best thing is to keep them out of the brooder entirely ,and this is my plan. But again, you must decide for yourself, for if you are raising only broilers, I would advise you not to run the risk of any change, but simply keep them during the 8 or 9 weeks of their life with the brooder heat at night. If you want them for breeders you might try my plan. I put straw in their inside run in the house and let them nestle down in that, and after a few weeks, it depends upon the weather, their size or thriftiness, I put a set of small perches in, I make a set for each indoor run and for a few nights I put those on the perches who have not sense enough to get on themselves, or I make a little platform of laths, (with the laths the width of one lath apart) and a few inches above this I put good perches one inch by three inches broad. These "platforms" I use in my weaning houses. I keep one or two ready to use at any time if I find chicks crowding or huddling at night. It is a sure cure. Little chicks are pretty and very fascinating in their little ways and games, but oh! how stupid sometimes and obstinate sometimes! I have found one whole brooderful will have to be put to bed like naughty children every night, they simply were perverse whilst their brothers and sisters in the next brooder gave me no trouble at all. And those little perversities kept it up till they were four or five months old, until I separated the sexes and even then I for a few nights found some outside in the yard. One has to have patience with chickens and children and I often wonder what the men poultry breeders do. Any change, such as change of sleeping apartment with chickens has to be made cautiously; they are very apt to take cold unless the houses are similar in ventilation, etc. One more item about little chicks wihch I forgot to mention in my last, if they get "stuck up behind," as it is called, do not wash this off with water, but pick it off gently and grease the place with carbolated vaseline. The "stuck up" condition usually comes from a chill or being overheated and if not attended to frequently ends fatally.

CHOLERA ERADICATED.

The San Francisco Dairy Review is authority for the statement that the veterinarian of the experiment station of the University of California, Dr. Archibald R. Ward, has announced the successful eradication of cholera among the chickens in Marin and Sonoma counties. This disease has for some time caused heavy loss among the poultrymen in this noted district and was spreading rapidly until checked by Dr. Ward's work. Fully $25,000 has been saved to the poultrymen.

Indications are that throughout the country eggs are becoming unusually scarce on account of the "short crop." Why such a contingency should be general throughout so large a country is hard to explain, unless, perhaps, hens are partaking of the great strike epidemic now everywhere prevailing. What their demands are we cannot imagine.—Farm and Ranch.

We know a woman in this part of the state, who has paid for her home of one and one-half acres, from the products of 100 hens and one Jersey cow. The home is valued at $4700, and is completely equipped. All this was done in less than ten years.

Some farmers may smile at the thought of feeding hay to fowls, but they will find chickens very greedy to consume finely chopped steamed clover hay mixed with ground corn, oats, and other grains.—Sentinel.

No hen will do its best in production when it is made uncomfortable by lack of proper shelter and proper feed.

The hen to produce best results needs as particular attention as the cow.

At a meeting of poultry men held in Petaluma last week, Organizer H. Murray said the egg men paid last season to commission men of San Francisco $108,000. That could be mainly saved if egg men would form a co-operative association and employ one man at $835, to attend to the selling.

OUGHT THE WIFE TO KEEP THE PURSE.

Without raising the question who should be boss of the family, the Edinburgh Scotsman discusses in a practical way, says the Baltimore Sun, the pros and cons of giving all one's earnings to one's wife and thus making her the financier of the family. It is especially important, our contemporary thinks, for this to be considered by the newly married, since the beginning of married life is the time to fix wholesome precedents of thriftful management. Among the very poor, it is stated, it is the rule for the wife to keep the purse, or rather, to spend the joint earnings, for when one lives from hand to mouth there is really no purse to keep. The problem is to get the most for the money, and the family income is never sufficient to satisfy pressing wants or desires. Woman's talent for negotiating small purchases fits her especially for the expenditure of small incomes. It is a familiar fact that in marketing, or other ordinary bargaining, she brings home more than her husband could for the same amount of cash. Under her management the whole income goes, but it obtains ordinary necessaries and comforts in greater variety and quantity. Among the very poor no great scope is given for thrift, since wages barely cover the necessaries of life.

It is when the income becomes somewhat ampler that feminine finance begins to seem at fault. The problem then for the purse-keeper is not merely to get bargains, but to provide for the contingencies of the family's future. "Experience," the Scotsman observes, "soon teaches the young wife the necessity of providing for daily wants from one payday to the next, but she is not so likely as her husband to realize the necessity of providing for far-off contingencies. The great incentive to saving is the desire to become independent; and neither by nature nor by training has the woman anything like the same feeling in this respect as the man. She may be earning her own living, but it is not for the glorious privilege of being independent. From her infancy her training has been to repress, rather than exercise, a spirit of independence. The necessity of saving is not presented to her in the same strong light as to the man." The latter lives in a larger world and is taught by circumstances to look further ahead. If he is ambitious—if he wishes not merely to stay where he is but to improve his position—he realizes the necessity of saving. It is not enough to make ends meet; there must be a weekly deposit in the savings bank if there is to be progress in the family's circumstances. Many wives appreciate the importance of the bank account as a means of rising in the world, but the majority, it is held, think no further than to get the most for their money. When the family income reaches the point that saving is practicable, masculine finance, our contemporary hints, must asert itself. There must not only be good bargaining by the wife for daily necessaries, but the husband should become a factor in the financial deliberations of the family and reserve part of his income for accumulation of capital.

Just here is where the Scotsman becomes a trifle cynical and unjust. The "model wife," it says, is always getting bargains and buying what she has no use for, just because they are bargains. She balances expenditure accurately against income, but keeps no books—not even a bank book. "She is seldom," it is added, "found in conjunction with the model husband, but she will do the best she can with any type of husband except one. That one is the husband who concerns himself with domestic affairs, who knows exactly what it takes to keep the house, who gives that sum to his wife, and puts the balance of his pay in the bank. That type of husband she cannot endure. If he were spending foolishly the money he is saving she would forgive him, even to seventy times seven. Every offense of that kind would show to advantage her own superiority. But to put her upon an allowance and to keep a bank account is to add insult to injury, and she resents it. She is not getting her proper place—he is master and mistress too—she is his slave and helping him to save for a second wife to spend. Her friends declare that he is starving the children and ill-using his poor, dear wife. But the worst of it is that unless he is a man of great resolution he gives up the attempt to save and tries to take all the pleasure he can get out of a hand-to-mouth existence." This is not fair to the average wife. In many families the wife is the thrifty member, and but for her there would be no saving at all. But for her there would be no home, nor education for the children. The average wife is fully as competent to carry the purse as the husband. At any rate try her. If she proves a spendthrift, then give her an allowance; otherwise treat her as a full partner in your business.

A poultry journal says, ducks should not be required to roost with the chickens. And there is no indication in the paragraph or the context that it was intended as a joke.

Chickens deprived of water at regular intervals will not thrive, no matter how much they are fed.

GO TO GARDENA

Where the alfalfa grows so luxuriantly, giving from 6 to 8 cuttings per year, and producing when fed to cows a superior product of milk and butter—the secret — there being no alkali to detract from the purity of the milk, as demonstrated by the noted Strawberry Brand of Butter made by Mr. Davis of Gardena. The success of our Chicken Ranches depends upon having green alfalfa as a food product in the production of eggs at a time of the year when the dry ranch farmer has no green feed to make the hens lay. Our small alfalfa, dairy and chicken ranches are making good livings.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 16 ACRES, $7,700.

A profitable farm with 6-room house, 2 large barns, chicken houses and corrals. Good bearing apple orchard, interset with Loganberries; 9 acres set out in young walnuts; ½ acre peaches; ½ acre raspberries; ½ acre strawberries; 1 acre rhubarb; 1 acre young vineyard; 2½ acres in alfalfa, and 3 acres to be seeded to alfalfa.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, seeas, corrals, etc. Plenty of water for irrigation and domestic use.

One-half mile frow two electric car lines Seven-room honse, barn, corrals, pasture, 17 acres alfalfa, 4 acres of strawberries, family orchard (all fenced) with a good pumping plant.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house snd barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

GRAY & NELSON

Gardena, Cal.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE, CAL.

GARDEN TROUBLES.

Mrs. F. C. W., Los Angeles, writes for advice on a number of subjects. The letter is too long for publication, but the matters are treated in the following:

Bulbs for boxes on porch may consist of Anemones (bulbous), soil well drained, keep cool and not too wet until growth appears: Ranunculi, same treatment as above, flowering season of both may be prolonged by shading from hottest sun. Narcissi, which should be planted twice as deep as the last two mentioned or about four inches. While the soil should be rich, no manure, either fresh or decayed, should touch the bulbs, they should be fed by top dressing. Ornithogalum Arabicum, which you call "black-eyed lily" is suitable of box culture—the pistil is a shiny-black while balance of flower is white. These bulbs may be fed more freely than the others and gladioli, which would complete the list, should have more water and food than any though all may be watered freely when growing.

The writer does not agree with the treatment often prescribed for the true Amaryllis or Belladonna Lily of shallow planting with the neck of the bulb left out of the soil. On the contrary the finest and most regular bloomers have been found deeply planted. Amaryllis are gross feeders and will stand a heavy top dressing of decayed manure several times each year and it matters little when such food is given.

The chief requirements of the Agapanthus are water and manure in liberal quantities during the growth and flowering season, allowing them to become dormant, if possible, for a time each year. The writer does not remember the bulbs reccommended by a writer in the Sunday edition of one of our dailies but can say with certainty that the writer of same is well posted.

CONIFERS FOR STREETS.

An observant writer of considerable experience begs to differ with the writer upon the subject of the impropriety of planting conifers (cone-bearing trees) along city streets. Pages could be filled with matter relating to this erroneous planting, by the best known authorities of the day, but we quote from one only (for lack of space), "Gardening in California," by Wm. S. Lyon, who had been in some department of the plant business for thirty years. "Both conifers and palms are frequently used for street planting but as language is not strong enough to condemn the impropriety of the use of either for this purpose no further attention is accorded them here * * * Public convenience demands the removal of all the lower branches for a heigth of eight or ten feet of trees that align a sidewalk or public highway. As the exquisite beauty of most conifers depends entirely upon the integrity of the lower limbs, the impropriety of planting any tree subject to these requirements becomes apparent. A notable exception can be made in the way of a boulevard of imposing width —not less than one hundred and twenty feet. On such an avenue or driveway a central line of Monterey pines may be tolerated." Writers differ regarding the use of palms along streets, but they seem to be consistently unanimous in the condemnation of the use of conifers.

THE FRIENDS WE MAY HAVE.

Squirrels make very interesting pets, but they cannot be attractive unless they are happy. If you live where there are squirrels and chipmunks, you will soon discover how friendly they are. I know one family of children who live in a little house in the woods in summer, who have been so kind and tender to the little people of the woods that they come fearlessly to the house. The squirrels and chipmunks know that in the stumps about the house they will find food that loving little hands have put there for them. They know that under the piazza are large bowls of water. The birds know that hanging in the trees are pails of water as soon as the spring gets low, and a visit to the piazza means a particularly dainty morsel. A squirrel can be taught to play with a ball or a spool. The story is told of a pet squirrel who would stop in the midst of a game of romp, and disappear, to return with a couple of nuts which he would drop down the back of the neck of the lady or little girl who was playing with him. The family thought that the squirrel did this as a mark of approval, for he never looked for the nuts again. It is worth while, if only for the amusement afforded, to make friends with the birds, squirrels and chipmunks about our homes in the woods.—The Outlook.

QUIT YOUR WHINING.

There isn't anything in the world more disagreeable than a whining person. He whines if it is hot; he whines if it is cold; he whines at this, and he whines at that—he whines at everything. Whine, whine, whine. It is just a habit he has fallen into. There is nothing the matter with him—it is just a bad habit. The whiner is generally an idle person or a lazy one. What he needs is to be set to work at real hard work, mental or physical—some work that will interest him, and engage his whole attention, and he will have no time left in which to whine.

We know two women. One of them does her own housework, and takes care of her horse besides. She is happy, and singing all the day long. The keyboard of her life sounds no whining note. It is a pleasure to be with her, a good, wholesome tonic to watch her. The other woman is so situated that she does not have to work—nothing to do but to amuse herself. She has no zest in life, no interest in anything. She is a bunch of selfishness, and she whines at everything. Whining has become such a habit with her that her most casual remark is tinged with a whine. She is miserable herself, and makes everybody else in her presence miserable. She is a weakling, a parasite—a drag, a heavy weight on somebody all the time.

Get the whine out of your voice, or it will stop the development and growth of your body; it will narrow and shrink your mind; it will drive away your friends, and make you unpopular.

Quit your whining. Brace up. Go to work. Be something. Stand for something. Fill your place in the universe. Instead of whining around, exciting only pity and contempt, face about, and make something of yourself. Reach up to the stature of a strong, ennobling manhood; to the beauty and strength of a supurb womanhood. There is nothing the matter with you. Just quit your whining, and go to work.—Medical Talk for the Home.

Not all Cultivator readers know that the value of salmon taken from Alaskan waters equals in value the gold output of that territory. About $50,000,000 of each have been produced. In sealskins the wealth from Alaska has exceeded those figures, being $52,000,000.

There is a plant at Fresno that works up stems and broken grapes rejected by the packing houses. They make from the refuse, oil, alcohal, tannin, tartaric acid, vinegar and other valuable articles. After the extraction of these products a meal is left, which is valuable feed for stock.

Under the direction of General Manager Briggs, of the State Board of Trade, the investigation is being pushed to ascertain why there is such a difference between the prices received by the producer of fruits and grains, and the prices paid by the consumer.

The United States annually pays millions for baskets and willow work that comes from Germany. Now a New England Yankee has succeeded in making a substitute for willow from paper. It is tough and durable and must inevitably displace the German article.

J. A. Kinghorn-Jones, of San Francisco, is arranging to buy a block of ground in the outskirts of the city on which he will erect a house of one thousand rooms for housekeeping. Rooms will be sold to families, to be paid for on the installment plan. It is a co-operative movement patterned somewhat after the plan of building and loan associations.

A voting machine was tested at the San Francisco election November 5d. During the day 576 persons voted in the machine to test it. It was closed at precisely 5 o'clock. In just five minutes the full returns of the vote on the respective candidates was announced. It is a marvelous invention and does its work automatically and accurately.

AN APPRECIATIVE BOY.

Little Charlie was dressed in his very best clothes one day, and really looked quite fine.

"Now," said he to his mother, "I want you to come to the window when I go out, mother, and watch me."

"I know that I can trust my little boy," said mother; "he will not be careless."

"It is not that," said Charlie humbly. "I want you to look out and be thankful that you have such a boy!"

SEATTLE'S APPEAL.

[There is a shortage of women at Seattle, Wash. Many unmarried men in that thriving city are yearning for wives, and an appeal for girls has been sent to the Mayor of Troy, N. Y., where the female population is greatly in excess of the male.]

Oh, give us girls! A town like this demands
Sweet girls, fair girls; we wish to claim their hands—
Girls who will darn our socks and cook our meals,
Girls who will stroke our brows when we are ill;
Girls who will listen to our fond appeals
When urged, by love, we look for girls to fill
The empty places at our firesides—
Oh, send us girls, if possible goodlooking,
If not, send any kind to be our brides,
To sew our buttons on and do our cooking.
—S. E. Kiser, in Chicago Record-Herald.

GIVE ME THE BABY.

Give me the baby to hold, my dear—
To hold and to hug, and to love and kiss.
Ah! he will come to me, never a fear—
Come to the rest of a breast like this,
As warm for him as his face with cheer.
Give me the baby to hold, my dear.

Trustfully yield him to my caress.
"Bother," you say? What! "A bother to me-"
To fill up my soul with such happiness
As the love of a baby that laughs to be
Snuggled away where my heart can hear!
Give me the baby to hold, my dear.

Ah! But his hands are soiled, you say,
And would dirty my laces and clutch my hair—
Well, what would pleasure me more, I pray,
Than the touch and tug of the wee hands there?
The wee hands there and the warm face here—
Give me the baby to hold, my dear.

Give me the baby! (Oh, won't you see?
* * * Somewhere out where the green of the lawn
Is turning to gray and the maple tree
Is weeping its leaves of gold upon
A little mound with a dead rose near)
Give me the baby to hold, my dear.
—James Whitcom Riley.

JACK'S TWO DINNERS

(Concluded)

Jack laid the letter down with a rush of new feelings and thoughts that overwhelmed him. He sat there for hours, he knew nothing of time. He had mechanically turned the cranberry jar upside down and taken from the bottom carefully wrapped in white paper, fifty dollars.

A pang went through him. Well did he know what that money represented to his sister; by how many sacrifices she had been saving it for a year of two, with the single purpose of taking the lessons from a great master that were to fit her to teach, to take an independent position in the world, to relieve her father who had lost a large slice of his comfortable income, and who was growing old and sad under his burden. She had often talked it over with him.

Now she had generously given up the whole to him; all her hopes and dreams of independence; and he—he who should have been the support of his sister, the right of his father—he had basely deserted.

These thoughts and many more surged through his mind that long afternoon, and when Tom returned as the shadows were growing long he sat exactly as he had been left.

On Tom's entrance he roused himself. There was a new light in his eye.

"Come, Tom," he said, "dinners' waiting. You must be hungry by this time."

"I am that," said Tom, who had been through his own mental struggles meanwhile.

The two sat down once more to their Thanksgiving dinner, and this time they managed to eat, tho' Jack choked whenever he thought of tasting a bit of Jessie's pet turkey, Winnie; and much as he liked turkey, and a home turkey at that, he could not touch it.

After the meal, when the provisions were stored away in the cupboard (a soap box) much too small for such a supply, it had grown quite dark, and the two, still disinclined to talk, went to their beds—if the rough bunks they occupied may be dignified by that name.

But not to sleep—at least not Jack, who tumbled and tossed all night and got up in the morning with an energy and life he had not shown for weeks.

After breakfast Tom shouldered his pick and said:

"I'll go on, Jack, while you clear up." Yet he felt in his heart he should never see Jack again; for there was a home-struck look in his face that the man of experience in the ways of runaway boys knew well.

He was not surprised that Jack did not join him, nor that when he returned at night to the cabin he found him gone and a note pinned up on the door:

"I can't stand it—I'm off for home. You may have my share of everything.

"JACK."

It was a cold evening in early December, and there seemed to be an undercurrent of excitement in the Jarvis household. The table was spread in the dining-room with the best silver and linen. Mrs. Jarvis was better, and had even been able to go into the kitchen to superintend the preparations for dinner.

Jessie went around with a shining face that no one understood and she could not explain.

Betty was strangely nervous and had made several blunders that morning which mortified the faithful servant very much. An air of expectancy pervaded the whole house, though the two heads of it had not a hint of the cause.

Jessie heard the train she decided to be the important one. She could hardly contain herself for expectation. She tried hard to sober herself now and then by the thought "Perhaps he won't come"; but she couldn't stay sobered, for she felt as certain that he would as that she lived.

You all know how it happened. The door opened and Jack walked in. One instant of blank silence, and then a grand convulsion.

Jack fell on his knees with his face in his mother's lap, though he had not thought a moment before of doing any such thing. Jessie hung over him, frantically hugging him. Mr. Jarvis, vainly trying to join this group, could only lay his hands on Jack"s head and say in broken voice:

"My son! My son!"

While Betty performed a war dance around the party, wildly brandishing a basting-spoon in one hand and wiping her streaming eyes on the dish-cloth which she held in the other.

It was long before a word could be spoken, and the dinner was totally ruined, as Betty declared with tears (though they were not for sorrow), before any one could calm down enough to eat.

Then the reaction set in and justice was done to the dinner while talk went on in a stream. Jack did not tell his adventures; he only said that he had come from the city, where he had made arrangements for a situation with Uncle John—at which Jessie's eyes sparkled. His looks, even after a week of comfort and hope, spoke of his sufferings.

There is little more to tell. Jack Jarvis at seventeen was a different boy from the Jack who at sixteen started out to seek his fortune. You may be sure that Jessie had her music lessons after all, and that a new Winnie with a fine young brood at her heels stalked about the Jarvis grounds the next spring.—Olive Thorne Miller in New York Independent.

THE MISSION OF THE STREETS.

When Margaret Andrews was twenty five she received what she thought was a call to the foreign mission field. Her parents, although at first they tried to dissuade her, put no obstacle in the way of her hopes, and full of eagerness, she began her training at a school in another city.

One day she received a telegram. Her mother had met with an accident; just how serious could not at once be known. Margaret packed her books, and took the first train for home, expecting to return in a few weeks. Long before the weeks had passed she knew that her dream must be given up. Her mother would never be able to do anything again, and Margaret, instead of making her journey to strange lands, saw herself shut into the duties of housekeeper and nurse.

For a year or two she bore her disappointment in silence; then she went to her pastor with it. The pastor was an old man who had known Margaret all her life. He looked at her steadily for a moment. Then he said, slowly, "You are living in a city of two hundred thousand people. Isn't there need enough about you to fill your life?"

"Oh, yes," the girl answered, quickly, "and I could give up the foreign field. It isn't that. But I haven't time to do anything, not even to take a mission class; and to see so much work waiting, and be able to do nothing—"

"Margaret," the old minister said, "come here."

Wonderingly the girl followed him to the next room, where a mirror hung between the windows. Her reflection, pale and unhappy, faced her wearily.

"All up and down the streets," the old minister said, 'in the cars, the markets, the stores, there are people starving for the bread of life. The church cannot reach them—they will not enter a church. Books cannot help them—many of them never open a book. There is but one way that they can ever read the pospel of hope, of joy, of courage, and that is in the faces of men and women.

"Two years ago a woman who has known deep trouble came to me one day, and asked your name. 'I wanted to tell her,' she said, 'how much good her happy face did me, but I was afraid that she would think me presuming on the part of an utter stranger. Some day perhaps you will tell her for me."

"Margaret, my child, look in the glass and tell me if the face you see there has anything to give to the souls that are hungry for joy—and they are more than any of us realize—who, unknown to themselves, are hungering for righteousness. Do you think that woman, if she were to meet you now, would say what she said two years ago?"

The girl gave one glance, and then turned away, her cheeks crimson with shame. It was hard to answer, but she was no coward. She looked up into her old friend's eyes.

"Thank you," she said. " I will try to learn my lesson and accept my mission—to the streets."—Youth's Companion.

WHAT HE THINKS OF BABIES.

A baby serves a manifold purpose in the world. He makes men and women more unselfish and furnishes the amount of trouble necessary to keep them comfortably busy. He sanctifies home and gives the doctor an excuse to look wise. A well-ordered, well-born baby with a red face and a bald head is a delight—particularly when he belongs to a friend, and doesn't spend nights in your neighborhood.

Every baby is the prettiest baby in the world and it can be proven by his mother. A baby that won't eat carpet tacks, brass-headed nails and young kittens is a mistake. Babies are bosses and boodlers. They control the first ward along with the twelfth, rule outrageously over the counties and take everything that cames their way without asking any questions. All babies are supposed, quite properly, to come from heaven, but what the angels, cherubim, seraphim and the rest of the celestial population do for sleep has never been inquired into. Boy babies are sweetest at 4 and girl babies at 24.

A baby is a joy forever until he begins to fall out of the second-story window, turn over the water pitcher, hammer the china to pieces with his

Cheap eggs are as good as cheap lamp-chimneys.

MACBETH.

fork and investigate the medicine bottles on the shelf. Every baby is eternally trying to find out more than he has any business knowing, and the habit of asking questions lasts through life. The touch of a baby's hand opens up heaven to a woman and makes a man willing to wear patches the rest of his natural life. It has been said that every woman is entitled to at least one child. So is every man, but nobody has ever mentioned the fact.

Borrowing babies is much sadder than it is funny. Some day the Government will go into the business and keep babies to rent out—as a matter of morals alone. Every old bachelor's quarters will contain a nursery and clubs will be a thing of the past.—Paris (Mo.) Mercury.

THANKSGIVING THOUGHTS.

The great American feast day is Thanksgiving. It is more essentially so in the New England States where more attention is paid to this day than any holiday of the year. At Plymouth, Massachusetts, in 1621 our forefathers inaugurated this annual American feast. Since then it has grown in prosperity until today it is the most popular of all our many holidays. We turn to other nations and find the Jews holding a yearly feast in their tabernacles; the Greeks celebrating the feast of the Demeter; the Chinese paying tribute with feasts and dances to their annual national holiday. "The Saxon Harvest Home" has been celebrated since the memory of man; and Thanksgiving since the revolutionary war. So we are continuing the ceremony from year to year, glad of the opportunity so to do, glad that providence smiles upon our fair land and peace and prosperity reign over the country.

Let the best of good cheer abound at our tables on Thanksgiving. May our boards be loaded with the best the season has produced, and our appetites be equal to the occasion.

In memories' halls are stored away many incidents which marked happy days in gone by times. The old cider barrel, with its contents fresh from the golden apple orchard, and spiced well with wintergreen—a drink fit for the best of men. The buttermilk, hickory nuts, hazel nuts, chestnuts, fine beyond description, the pies and cakes, and puddings, and lastly the games we used to play when tired from eating we took to play to ward off horrid nightmare. Oh ,we have all been there, and we know the pleasure and the pains of the old Thanksgiving times.

A THANKSGIVING SACRIFICE.

"Old Speck" was the proudest hen turkey on the roost. She was the first to fly up into the tree at night and the first to say it was time to get up in the morning. She kept her feathers nicely plumed and Aunt Emma always called her the "Lady Turkey."

Early one spring, she stole away from the flock and made a nice nest in the woods near by. Before long, Aunt Emma missed "Old Speck," and said, "Surely it isn't time for turkeys to be setting." But sure enough, about a month later up came "Old Speck," with seven cold, bedrabbled little turkeys followed her. "Old Speck" looked pitifully up at Aunt Emma, as if asking her to help her out of her troubles, and Aunt Emma added her protecting wing to those of the mother and soon all were made comfortable.

Before long, the happy family were playing about the dooryard, basking in the sun, and always ready for the warm mashes brought them. "Old Speck" pecked her children sharply and scolded severely if she found any one being greedy, for she told them that they must be kind to one another.

All went well and nothing of importance happened until two nights before Thanksgiving. Aunt Emma told Tom that she wanted him to pick out the best turkey from out of "Old Speck's" brood for the Thanksgiving dinner. So he went out to the roosting tree to find out where the fatest ones roosted. Now, it happened that Jake was down on a lower branch and his brother Mike, from a limb above, heard the farmer say: "This is the one we will have." The night before Thanksgiving, Mike persuaded his brother Jake to fly onto one of the higher branches; then after all were asleep, he flew down and sat meekly in Jake's place. Sure enough, the farmer soon came and without further investigation took Mike by the legs and shut him up ready for slaughter.

After he had been killed, but before the feathers were off, little Mary said: "Papa, I am sure this is Mike, and you said we were going to have Jake for dinner." But the family really never knew how their Thanksgiving turkey sacrificed himself to save his brother. —Barbara, in Successful Farming.

RECIPES

Eat Little, but Have That Little Good

Mince Pie.—One cup of chopped cooked meat, one cup of seeded chopped raisins, one cup of cleaned currants, one-fourth cup of chopped citron, one cup of brown sugar, one-fourth cup of molasses, three cups of chopped apple, one cup of meat liquor, salt if needed, one teaspoonful of cinnamon, one-half teaspoon of mace, the same of cloves, one lemon, (the grated rind and juice), one orange, the same way; one cupful of boiled cider. If you cannot get this last, use the same amount of the rich syrup from apple sweet pickles. Mix all thoroughly and cook until the apple looks clear. Fill your tins, which have been lined with rich pastry, cover with the pastry and cook until browned nicely. This is rich enough to cause dreams!

Plum Pudding.—Roll enough butter crackers to make one pint; wash and stem one pound of seedless raisins and put them with the crackers into three pints of milk and let them soak for an hour. Cream together one cup of sugar, and a quarter of a cup of butter, adding a half teaspoon of salt and the same each of cinnamon and grated nutmeg, and six eggs, one at a time, beating each well into the sugar. Stir into this the milk and cracker and raisins, and when the sugar is dissolved, turn into a deep pudding dish well greased with cold butter. Bake very slowly in a moderate oven three or four hours. Stir frequently from the bottom, but not from the sides, during the first hour, to prevent the raisins from settling. It should also be covered at first to prevent any crust forming until the raisins are evenly distributed. This may be made several days before wanted and served cold, or if you wish, steamed. It may be served with any preferred pudding sauce.

Carrots.—Put into a baking dish a layer of carrots, peeled and sliced, thin; sprinkle with pepper, salt, a little flour and bits of butter, then another layer seasoned as before, till the dish is nearly full; cover with sweet milk and cream and bake until tender.

STUPENDOUS STUPIDITY.

Stubbins' wife came into the room where he was sitting. She was twisting herself around in the effort to look at the back of her new blouse. By the tense line and bulging aspect about her lips, he knew that her mouth was full of pins.

"Umph — goff — suff— wuff — sh — fspog!" she said.

The briliant sally caused him to look up.

"Yes," he said, "it looks very well."

"Owf—wuff—so—gs—ph—mf—ugh —light!" was her next remark.

"Perhaps it would look better if you did that," he said, "but still, it fits very nicely as it is."

She gasped and emptied the pins into her hand. Then she said, with asperity:

"I've asked you twice to raise the blinds so that I can get more light," she said. "Can't you understand plain English?"

Of course he might have made an impertinent remark had he been a brute. But he was not a brute. Besides, he knew from past experience that that sort of thing usually led to more new blouses, and he held his peace and did her bidding.—London Answers.

During 1902, we sold American farm products to Japan to the extent of $12,000,000.

BEAN SPRAY PUMP CO., Santa Clara St., San Jose

Los Angeles Markets.

Los Angeles, November 25, 1903.

There has been no change in the butter trade this week and prices remain about at last week's quotations.

Prices have ruled so high on turkeys as to render them almost prohibitive. They sold from 25 to 30c early in the week, but fell off some yesterday, as the buyers turned from the offerings to other meats.

The egg market is firm.

Butter and cheese steady locally, although the northern markets are reported dragging since the rains.

Beans are firmer and jobbers report the lay-down cost gone up.

Potatoes and onions continue firm.

Fresh fruits in good request, especially for apples. Some Cornichon grapes from the North offered daily.

Other commodities steady at jobbing prices heretofore quoted.

San Francisco Markets.

Dairy.

SAN FRANCISCO, Nov. 25. 1903.

Really fancy creamery butter was offered in small quantities this week. There was a good deal of medium and under grade offered.

BUTTER—Per lb:

Creamery, extras	32	@33
Creamry, good to fancy	26	@30
Dairy extras	24	@25
Dairy choice	22	@23
Store	18	@20
California storage	24	@27
Eastern Creamery	23	@25

Cheese remains at former quotations.

Eggs and Poultry.

Thanksgiving has made a strong demand for all kinds of poultry, and eggs have been in active demand.

EGGS—Per doz:

Ranch, selected large	47	@50
Ranch, good to choice	44	@46
Store	Nominal	
California storage	28	@32
Eastern	25	@30

POULTRY—Old Roosters, per doz, $5@5.50; young Roosters, $5.50@@6.50; Fryers, $5@ Broilers, large, $3.50@$4 small, $3.00@$3.50; Hens, small, $5@6; large, $6.50@7.50; Ducks, per doz, old, $4.50@5.50; young, $5.50@6.50; Turkeys, per pound, 18@20c; Dressed Turkeys, per lb, 21@23c; Geese, per pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz, old, $1@1.25; Squabs, $2@2.25.

Fruits and Vegetables.

There has been a level trade in fruits all the week, although not quite up to last weeks' reports. Prices ruled firm with the following quotations however:

California apples, per box, common, 40@65c; choice to fancy, 85c@$1.25; extra, $1.50@$1.75; Oregon, Spitzenbergs, $2.25; Lady Apples, $1.25@$2.

Pears—Per box, Winter Nelis, $1.25@$1.50; other varieties, 50@75c.

Pomegranates—Per small box, 75c@$1; large box, $1.50@$2.50.

Persimmons—Per box, 50c@$1.

Oats, "	286,400	191,800
Rye, "	5,800	3,200
Barley, "	141,100	15,700

Chicago Live Stock.

CHICAGO, Nov. 25.—Cattle—Receipts, 7000, including 2000 Texans; steady; good to prime steers, 5.10@5.65; poor to medium, 3.50@4.80; stockers and feeders, 2.00@4.10; cows, 1.25 @4.00; heifers, 2.00@4.60; cows, 1.25@2.30; bulls, 1.75@4.35; calves, 2.00@6.50; Texas fed steers, 2.75@3.50; western steers, 3.00@4.50. Hogs—Receipts, today, 35,000; tomorrow, 35,-000; opened 10@15c lower, closed steady; mixed and butchers, 4.95@4.45; good to choice heavy, 4.20@4.32½; rough heavy, 3.70@4.15; light, 4.00@4.25; bulk of sales, 4.15@4.25. Sheep Receipts, 18,000; sheep and lambs steady; good to choice wethers, 3.65@4.25; fair to choice mixed, 2.75@3.60; western sheep, 2.50@3.85; native lambs, 3.50@5.50; Western lambs, 3.50@5.00.

DAIRY MARKETS.

On the Produce Exchange today the butter market was firm; creamery, 16@24; dairy, 14 @19. Eggs, firm at mark, cases included, 23 @26; cheese, steady, 10@10½.

California Dried Fruits.

NEW YORK, Nov. 25.—The market for evaporated apples continued easy in the absence of important demand; common, 4@5; prime, 5½@5¾; choice, 6@6¾; fancy, 7. Prunes show a rather irregular movement, but on the whole are quiet. Quotations 2½@6½ for all grades. Apricots quiet; choice, 9¼@9½; extra choice, 10¼, and fancy, 11. Peaches quiet; choice, 7¼@7¾; extra choice, 7¾@8¼; fancy, 9¼@10¼.

CITRUS MARKETS

THE ORANGE MARKET.

There is but little to report in the way of an orange market this week on account of very few cars from California having arrived in the different markets. Thanksgiving shipments, or those intended for Thanksgiving, have in may instances failed to reach destination up to date. The cars that have arrived have brought good prices, and the fruit is giving satisfaction, generally speaking, although there are some complaints of its being too green, or rather too poor color, the eating qualities apparently giving better satisfaction than the outside appearance.

Auction markets have been selling a large quantity of Floridas and Jamaicas at low prices, and competition from Floridas in the interior markets as far west as Missouri river points will be keen.

Shipments are going out from the northern part of the state in good quantities, and a few scattering cars are this week being started from southern points. Sizes in Northern California are running rather large, which will more or less handicap consumption of the fruit from that section, while southern shipments, if the first cars are any indication of what can be expected, will show very desirable sizes.

THE LEMON MARKET.

The lemon market continues in quite satisfactory condition, even under liberal shipments from California, as well as an increase of foreign supplies over last year. Californias continue to sell in large Eastern auctions at considerably higher prices than the foreign product. Demand in smaller western markets is quite limited, and there is practically none for any very low grade stock.

AUCTIONS.

NEW YORK, Nov. 19.

A. C. G. Fruit Ex. Blue Seal lemons, $6.50. Red Shield $4.45.

CLEVELAND, Nov. 19.

A. H. Ft. Co., Palm Tree lemons, $2.20, Elk lemons, $2.30.

Totals to date for season 170 cars of which 135 were lemons.

KNOCK-DOWN TANK.

A monkey-wrench and a hammer is all that is needed to set up one of Mr. Wilson's "Knock-Down" tanks. These tanks are made by one of the oldest mills of Stockton, R. F. Wilson, the owner, showed the writer of this article his factory a few months ago and it was quite interesting to note the manner in which these tanks, also windmills, are put up ready for the farmer. Mr. Wilson has been located near the steamer landing in Stockton a great many years. He gets his lumber direct from the mills by steamer, thus giving him command of low rates. This, with his command of the best material and the fact that he is satisfied with reasonable profits, has given him a large business in the northern and central part of the state. But where he can reach and secure reasonable transportation charges, has sent his tanks and mills into the extreme southern end of the state as well. He will give his prices for goods delivered so that any one may know to a certainty what the cost will be.

Mr. Wilson's business has increased and compelled the extension of his grounds, until he now covers nearly a block with his mill and yards.

SUMMONS.

No. 42415. Dept. No. 5.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Chas. B. Estill, plaintiff, vs. Mollie Estill, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the clerk of said Superior Court.

The People of the State of California send greeting to:

Mollie Estill, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for any other relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 19th day of Sept., A. D. 1903.

(Seal) C. G. KEYES, Clerk.
By C. O. Winters. Deputy Clerk.

STOCKMEN, SEEDSMEN, NURSERYMEN

Your Catalogue or Booklet

We are headquarters for this class of work, having ample facilities by reason of large fonts of body and black letter in all the standard sizes; our presses and display type are the best and most modern that money could buy Being familiar with the common and technical names of plants, and the literature of advanced horticulture and agriculture, we not only guarantee a superior quality of work, but accuracy and literary excellence in its arrangement and classification. In the matter of preparing copy our experience is at the service of all who favor us with their printing. Correspondence invited. You do not go to a blacksmith shop for watch repairing, nor to a tailoring establishment for farm machinery; then why should you trust your catalogue and general printing to firms inexperienced in this class of work.

SAFE AND SURE METHOD OF PREVENTING FROST

USE DISTILLATE

NO SMUT
SIMPLE AND
EFFECTIVE

Note the following extracts written by prominent fruit growers:

"If growers would generally place pots in their ranches, 25 pots fired per acre, in any frost we have had, would thoroughly protect the trees and fruit. I am sure many more will put in the oil pots next winter."—D. B. Bailey, Rialto, San Bernardino County.

"I am perfectly satisfied with the results. It furnishes sufficient heat to prevent frost damage during periods of cold weather and does not smut the fruit or trees' I find it even possible with these devices to carry the winter blossoms in my lemon grove through for summer crop."—N. W. Moodey, Glen Ellen Orange and Lemon Grove, Centerville, Fresno County.

"During the recent frosts the oil pots saved our crop except a few on the outside of the ten acres of Valencias."—W. R. Wood, Exeter, Tulare County.

"I found that, although the temperature fell to 20 degrees outside the protected area on January 16th, and again on February 14th, 40 pots to the acre gave me all the heat I needed for protection. I estimate that the crop saved on the Camilla orchard this season is worth $20,000. The fruit is healthy, wtih fine flavor, weight and color."—N. G. Simms, Camilla Orange Grove, Lindsay, Tulare County.

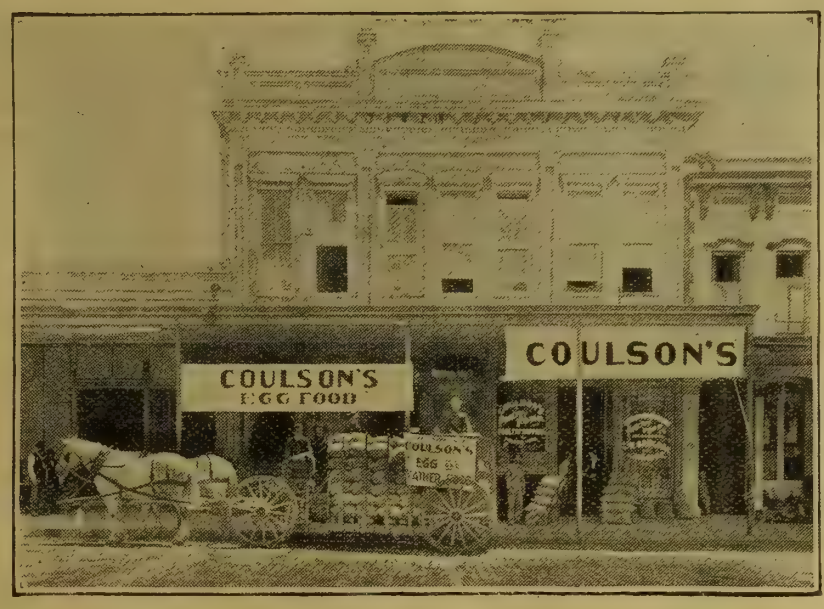
EGGS

Now is the season of the year that eggs are worth having to sell and the more we have to sell the better we like it; therefore, if we are in the poultry business, we want to feed the hens the kind of feed that will make them lay. It is worth something to know just what is good to make hens lay, but there is such a feed and one can buy it already mixed to feed, and it doesn't cost any more than any other feed in the end, because it is richer and goes farther. The Balanced Ration Egg Food, prepared by the A. R. Coulson Company of Petaluma, is what the Petaluma poultrymen use to make their hens lay. Not only Petaluma poultrymen, but poultry raisers all over the state of California are beginning to find that it is more profitable to feed Coulson's Balanced Ration Egg Food than any other kind of feed.

A. R. Coulson, the chicken doctor of Petaluma, has made a special study of the feeding problem and he has got it down to a science, and so successful has been the use of this food that $25,000 was invested by the company to manufacture this feed and sell it as cheap as possible. All the ingredients are purchased in carload and even shipload lots, as steamers and schooners come daily to Petaluma loaded with



grain and feed. By purchasing everything in immense quantities they are able to use the best of everything needed in the feed and still be aole to sell it to the poultrymen at reasonable prices. The granulated or fine ground dried beef blood is prepared at the largest packing houses in the world, at Kansas City, and shipped to the A. R. Coulson Company, in 25 and 30 ton lots (the value of a big carload of this article is nearly $2000.) Fine ground beef meal and beef scraps are also shipped from the packing houses at Omaha and Chicago.

There are about twenty different articles used in preparing Coulson's Egg Food and they are all purchased in large quantities and mixed in a large electric mixing machine (the only one like it on the Pacific Coast), and from 250 to 300 sacks a day are turned out at this factory.

It is a good thing for the poultrymen to get this feed already mixed in this way, for you only have one profit to pay, where if the poultryman was to purchase each article separately he would have to pay a profit on each article used, and the more expensive articles he could not afford to use, as on small quantities of some articles would cost the poultryman if he purchased it a few pounds at a time, 10c or 12c a pound, so that he could not afford to use it; but where it is purchased in 30,000 or 40,000 pounds at a time the same article can be had for 2 or 3 cents a pound; therefore it is much cheaper to buy Coulson's Egg Food already mixed and save time, labor and expense. Besides, when you get Coulson's Egg Food you can rest assured that it is prepared just right and contains everything in the right proportions, and is more thoroughly mixed, being mixed in a machine that mixes every portion together so thoroughly that every part is just alike, after it comes out of the machine. If you want to get eggs you must feed that which makes eggs. A hen is simply a machine; feed her properly and feed enough of the right kind of feed and you are bound to get eggs.

In order to get eggs out of a hen we must put eggs into a hen, or in other words, we must feed right, and Coulson's Egg Food is just the feed that Biddy needs to help her make the eggs.

You can get Coulson's Egg Food at most any feed store, or, if not, you can send to factory at Petaluma and have it shipped by freight.

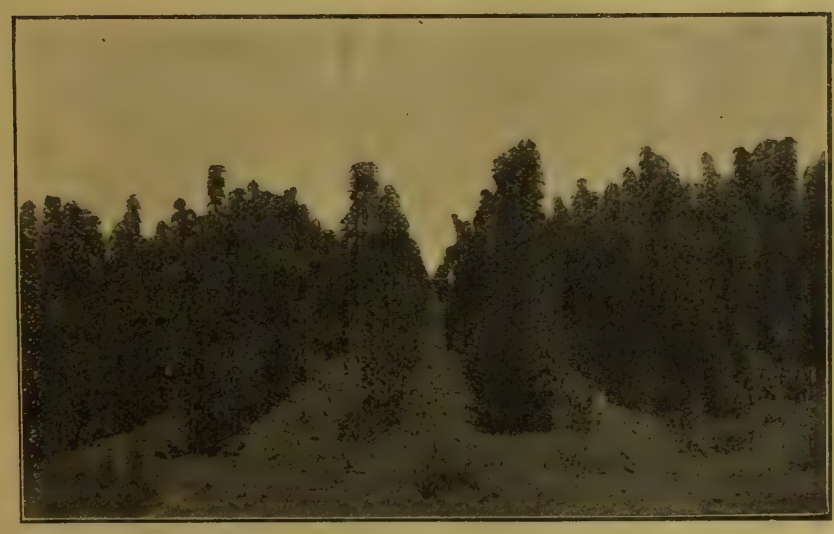
LOS ANGELES SAN FRANCISCO

DECEMBER 4, 1903



IN DINUBA, WHERE GRAPES GROW BIG AND TREES GROW TALL.

Some time since we gave a cut of scenes in Dinuba, particularly on the ranch and nurseries of F. H. Wilson, owner of the Fresno Nurseries. Those cuts were not satisfactory to us, hence we reproduce two of them above. One shows scenes in the nursery devoted to Smyrna fig propagation and shows the men busy irrigating. This view was taken some months ago, before the figs had attained the growth that they now have. They are the genuine fig of commerce. The other picture shows a block of young plum trees. Mr. Wilson is standing between rows of the trees, yet is almost hidden by the luxuriant growth. They are fine trees, as are thousands of others in Mr. Wilson's nurseries.

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXI—No. 23 LOS ANGELES, CAL., FRIDAY, DECEMBER 4, 1903 Subscription $1 a Year

THE APPLE ORCHARD

Mr. F. W. Maskew, in his address to the Farmers' Institutes, lays down the business proposition that to be a successful orchardist, one must, among other things, do three things specially. First plant the orchard properly. This requires a selection of the fruit trees adapted to the soil, and the climate, Second, plant trees adapted to the market if the object is to secure commercial results, and third, plant only the best of the finest varieties, and then tend them as one would tend an expensive pure blood cow. If the orchard is for home use, the flavor of the fruit should be taken into consideration, also the time of ripening, so as to provide for the different seasons of the year. If the object be to secure a commercial orchard, location, with reference to the nearest city, or cold storage should be taken into account. One can do well on summer and fall varieties if near a market. While if away from markets and storage, one should plant varieties that will keep well; fruit that can be handled and stored without injury. Some varieties spoil easily in handling, and some scald and turn black in storage or soon after taken from it, as the Huntsman's Favorite and the York Imperial, otherwise good apples.

Trees must be selected with reference to the time or age when they begin bearing, also with reference to the quantity of fruit borne annually.

* * *

Size and Age.—The variety of apple having been selected, the next question to consider is what size or age of tree to plant. Most well advised apple orchardists say, a tree two years old is the most successfully grown. This two year old apple tree you can train to make the proper head. A proper head must have a center. That is, not two, three, or more limbs of an equal length, but one larger and extending above all the others. The branches should be trained back to make limbs, not forks.

Prepare a hole large enough for all the roots. Head the tree low. Do not plant deeper than the tree stood in the nursery. Too deep planting, says John Y. Stone, the apple king of Iowa, makes "root rot." The tree should be the largest at the surface of the ground, and there is where the roots should start.

Fine stock breeders tell us to look to nature if we want a correct guide for our efforts, so in the planting of trees of all kinds we should "look to nature," for God knows how to grow a tree or a forest.

Look at the oak, elm, and all the trees including the seedling fruit tree, it has roots spread from the surface of the ground. Nature has a reason for this to prepare the tree roots in spring and autumn for the circulation of the sap, and roots that should be near the surface to receive the heat and magnetic influence of the sun, and give the tree the greatest circumference at that point. When they are planted too deep in the ground, they die. Trees will sometimes try to correct their errors by sending out a new set of roots at the surface of the earth. We hunt with a microscope in vain for the cause of the "root rot," which we ourselves have produced by banking the earth too high around the trees.

As to Varieties.—The primary conditions for planting having been considered, the next important matter to determine is what varieties to plant. Here the individual choice of the orchardist must largely control the seting of the trees. In California most of the choicest varieties of apples are grown or could be grown with the same care that is exercised in other states. This is the opinion of men like Mr. Maskew, and Mr. Wilson of Long Beach.

Perhaps H. G. Keesling, of Santa Clara, is as good authority on the kinds of apples to plant to produce a satisfactory orchard as we have, and we here quote from some personal letters, recently received from him on this subject.

"The nine best sorts of family and market orchard apples, if a succession is desired, are given in the order of their ripening, and give a constant succession of fruit from the time Red Astrachans begin to color, about July 1, until the Newtowns are all gone, which will be nearly, if not quite, eleven months later, if they are properly handled and stored. Red Astrachan, Red June, Gravenstein, Skinner's Seedling, Fall Pippin, Bellflower, Jonathan, W. W. Pearmain, Newtown Pippin.

"The above may well be called 'the big nine,' for planting in Central and Southern California," and will all make thrifty growth and bear good crops if properly cared for.

It is peculiar, but true, that while I have known and grown these varieties for the past twenty-five years or more, in this valley, and do not now know of a single variety that I would exchange for any of them in its season, yet, I am still planting and testing new (to me) varieties. About fifty varieties will come into bearing next year and if ten of them prove worthy of a place in a California orchard, I will be more than satisfied.

The Red Astrachan.—This is our earliest sauce apple, ripening here about July 1, and it contains a flavor that for sharpness and snap is not found among the early apples. Almost too sharp to eat from the hand, but excellent for sauce and pies.

One or two trees will supply an average family until Gravenstein is ready. The tree is a strong grower while young and is inclined to make a close leafy top, which puts off the bearing age two or three years. Judicious thinning of the branches should be practiced from the first, in order to get apples early and to form a top for bearing and long life.

(Continued on Page 449.)

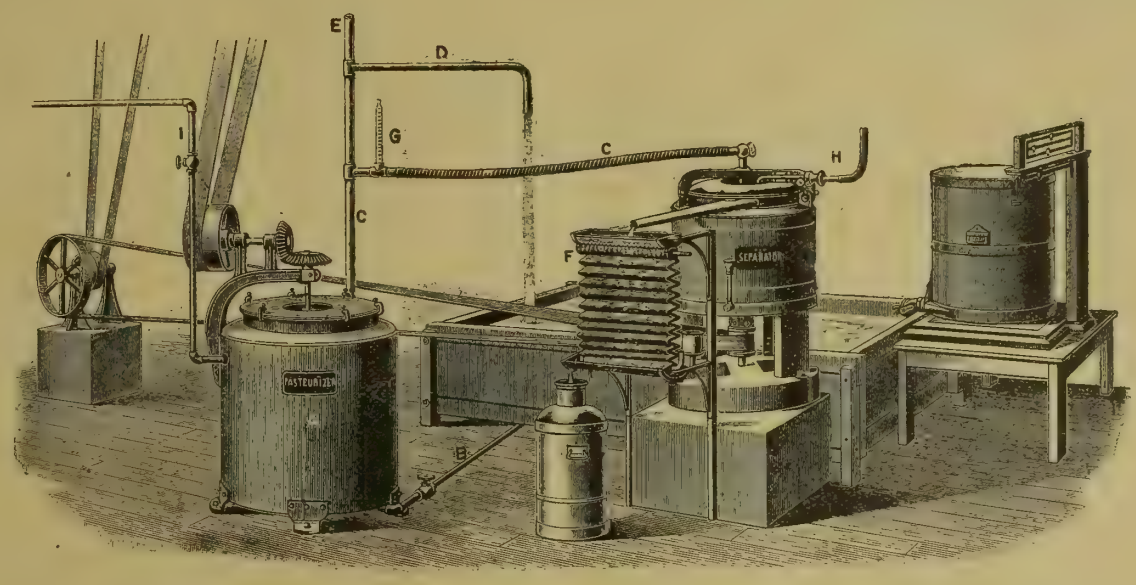
LOS ANGELES POULTRY SHOW.

All readers of the Cultivator will be interested in the poultry exhibit at Hazard's pavilion, December 8-12. This will be a very interesting meeting, as 150 birds are exhibited from San Francisco and a number from other points. Several prizes are offered for the best birds shown, The Times Eagle Trophy, the Riverside Fanciers' challenge cup are especially fine.

The Petaluma Incubator Company, the Los Angeles Poultry Association, Mrs A. Basley, the White Plymouth Rock club and the National White Wyandotte club each offer fine prizes for the best display of birds.

An effort is being made by the California Creamery Association to secure the National Butter Makers' Association convention for 1905. To this end it is proposed to make a mammoth exhibit at St. Louis next year.

Five thousand of the public school children of Missouri are being taught the rudiments of agriculture and it is expected that as soon as competent teachers can be secured agriculture will be taught in all the rural schools of that state.



The above cut represents the milk being separated after pasteurizing, as explained in the article on page 444. Milk flows through supply pipe and regulating receiver B from Receiving Vat into Pasteurizer A, is Pasteurized and raised through pipe CC into Separator. Cream flows over Cooler F, skim-milk passes out tube H to skim-milk Vat. I, steam supply pipe and regulating valve. G, Thermometer. If preferred, the milk can be fed direct to the cooler instead of passing through the Separator, which is generally done in dairies.

IMPORTANT MEETING.

The annual meeting of the California Water and Forest Association will be held in accordance with the provisions of its by-laws on Thursday, the 10th day of December, 1903, at 10:30 a. m., in the rooms of the Chamber of Commerce, 307 Sansome street, San Francisco, Cal.

After the reports of the investigations have been received it will be known whether it will be necessary or not to appear before the next legislature of California with a request that the appropriation made by the state at its past legislature for the purpose of conducting investigations in connection with the Departments at Washington shiuld be continued for the years 1905 and 1906.

ITEMS OF INTEREST.

Great Increase.—State Controller E. P. Colgan and his office force have made up the total of property valuations in the state as returned by the auditors of the various counties, and a considerable increase over the valuations of 1902 is shown.

The total assessed valuation, exclusive of railroad properties, for 1903 is $1,513,756,482. The total assessed valuation of railroads is $84,187,758, making a grand total of $1,597,944,240.

No other state in the Union has made such rapid strides in wealth during the year 1902 as California.

* * *

Panama Must Ratify.—The decision reached by the president that the Panama government must ratify the Canal Treaty before this country takes formal action on it, is wise, of course. This government does not propose to be caught as it was with Colombia. After Panama has formally ratified the treaty the Senate of the United States will do so and it then remains to be seen if Colombia wishes to engage this nation in a "death struggle," to retake the Isthmian Canal country.

* * *

The Compton Institute. — A highly interesting farmers institute was conducted by Professor A. J. Cook assisted by an able corps of special assistants on Saturday of last week. The usual preliminaries incident to an institute of this character were indulged in, such as the address of welcome and response, then the regular program followed. The papers and discussions were all of interest, and some of them of a very high order. Mr. F. W. Maskew devoted an hour to the apple, and in this time spoke at length on the early history of the apple and its gradual perfection to its present excellent standard. He divided his topic into three divisions. Soils adapted to the best growth of the apple, varieties, which includes the kinds best calculated for Southern California, and the care of the orchard when once set out. He advocated planting only the best of the best kinds—the choicest varieties. His appeal to orchardists to tend their trees, as they should their finest stock was strongly put and well received by the large audience present, a half of which wre fruit and apple growers.

Mr. Moore, read a most excellent and practical paper on the up-to-date dairy. It goes without saying that his argument was based on the necessity of procuring the best stock for the dairy, and then giving the stock intelligent attention. He embraced three principles as essential to success in dairying, good breeding, perfect sanitary regulation for the care of milk, vigilance in looking after the cow and kindness, patience and ability to win the confidence of each individual animal. Many intelligent thoughts were presented in this paper and it was well received.

Mrs. M. E. Sherman of Fresno, presented a paper on dairy interests which took a somewhat broader line of discussion, than the one read by Mr. Moore. Mrs. Sherman's experience in this branch of California industry makes her papers of more than common interest as well as her treatise on vineyards and kindred subjects.

A very interesting discussion quite generally indulged in, followed the reading of Mrs. Sherman's fine address which evinced a keen appreciation of the merits of the subject by those engaged in dairying. The general interest manifested in the proceedings of the institute was greatly appreciated by Prof. Cook and the local members who had the meeting in charge.

* * *

Delay in Transmission.—It is asserted that the delay in the transmission of goods from the Pacific Coast to Eastern markets is being attended with great inconvenience. At a later period when shipments are crowding the result of this inexcusable delay, would be seriously felt. The present delay is affecting prune and raisin sales more than any other commodities, and causing jobbers to be slow in placing orders for large amounts. A New York correspondent writing under date of November 23, speaks somewhat discouragingly of the raisin market at this time, for the trade regards the price as too high and the situation too uncertain, as to maintenance of price by the association to permit anything more than hand-to-mouth purchases.

The situation may change after February 1, the time to which the present prices are guaranteed by the association.

* * *

Commission Cannot Act.—Attorney-General Webb of this state has given an opinion to Gov. Pardee to the effect that the State Commission of Horticulture cannot take possession of and destroy trees, vines or orchards and vineyards which may be affected with contageous or infectious diseases.

This opinion ought not to obtain, for if the owner of an infected orchard will not take the time and trouble to clean it, it should be cleaned or destroyed by some properly constituted authority, else it may work the ruin of a whole section.

Nearing the End.—Claus Spreckels, the millionaire sugar king, who is regarded as the richest man on this coast, is ill, and his age and the fact that he recently had a stroke of paralysis make his condition critical. He is probably nearing the close of his active life.

* * *

Failures in October.—Failures in commercial world, as shown by the mercantile reports for October, were confined largely to the manufacturing industry. Compared with last year there was an increase. Bank suspensions also were increased. Settlements of accounts and liquidation of securities is probably the direct cause of the decline in the latter interest, and in this particular indicate, in a modified degree, business depression. We may expect more of this same depression as the annual settlements of the past year are made, but it will not be widespread enough to create a general slump in values. It is simply the collapse of bubbles which were created "on wind." In the face of the prosperity of the agricultural sections and the activity in general trade, as evidenced by railroad movements, faith in the future is amply justified.

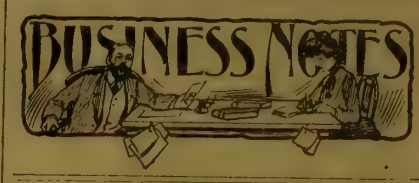
* * *

Farmers' Trust.—A fifty million-dollar Farmers' Trust is the latest venture along promotion lines. The farmers of this country are getting tired of producing for the benefit of capitalists and middlemen. To put it the way a leading farmer of Kansas states, "The producers are getting tired of trusts and middlemen, and we have declared it time for the farmer to find a way to sell his products direct to the markets. The beef that you pay eighteen and twenty cents a pound for, we have to sell as live stock to the middleman for one and a half cents a pound. Wheat would bring us from five to ten cents a bushel more if we could wipe out the middleman. Our people are sick of it."

If the farmers of the United States combine, as they should, to regulate prices for products, the day of the middleman is passed.

* * *

Supreme Court Decision.—A case of general interest affecting the rights of telephone companies on private grounds has just been decided by the Supreme Court of Kansas. The telephone company secured the right from the Board of Supervisors to erect poles on the public highway. In doing this a pole was set so as to inconvenience a farmer, who requested the company to set the pole to one side. The request was refused. The farmer cut down the pole and was arrested. On the hearing he was discharged. Suit was then entered against him for damages. Again he won. The case found its way into the Supreme Court of the state. This court has just handed down its decision; it holds that the telephone company had no right there; that the county authorities had no right to grant franchise for poles, as that use was not within the easements granted by the land owner, who had dedicated a part of his land for road purposes; that the use of the road for telephone purposes was not legitimate, and that the farmer was within his rights in removing the pole; that the telephone company must secure the right to place poles, from the abutting land owner before it can legally erect its poles. This is sound doctrine and doubtless will be followed by courts of equity throughout the country in cases involving the authority of boards of Supervisors to interfere with the rights of private property.



STILL GROWING.

Our readers will notice that the number of papers for this issue takes a notch higher. We had hoped to add two hundred again this week, but our men in the field sent us in less than their usual quota, owing we suppose to too much Thanksgiving. However, the Cultivator is growing and the 10,000 mark is now in sight—only two hundred more subscribers needed.

That the Cultivtaor is appreciated by its old readers is daily attested by letters received. Follwing is a sample:

Nordhoff, Cal., Nov. 30th.

Cultivator Publishing Co. I enclose you two dollars arrearage on my paper, sorry to have neglected it so long. I think a whole lot of the Cultivator. I read every word; advertisements and all. Yours very truly. —F. Udell.

* * *

GOOD RESULTS.

Geo. R. Tyler of Pomona, was a caller last Saturday and contracted for an advertisement for his pruning saw for the season. He stated that the Cultivator ad. brought him better returns last season by several times than any other paper he used. Mr. Tyler has a good saw.

* * *

Among our new advertisers this week are, T. Frank Anderson, who has bought the stock of the White Plume Poultry ranch, owned by Mrs. Basley. He ought to have a fine business as both stock and name is well and favorably known.

* * *

Jas. Mills of Riverside is calling attention to his seed bed citrus stock. Mills & Masters, also of Riverside, have a promiñent ad. in calling attention to their fine stock of citrus trees; and Richman & Mills of Fullerton, one of the old stand-by firms, make their annual announcement, laying particular stress on their stock of walnuts and apricots. Another old established firm who again ask for their share of patronage is the California Nursery Co., of Niles.

* * *

The Sharples Tubular Separator people are to be represented in Los Angeles by W. E. Hyer & Co., who have opened up a good stock at 108 North Los Angeles street. The company will also sell the Sunset Incubators.

* * *

A new advertiser in the Cultivator columns, although old established at Oakland, is the Jubilee Incubator Co. This firm have for years been putting out a steadily increasing number of machines, which prove their merits.

DOWN TO THE BONE.

The original Bristow report on the Postoffice Department investigation, with the testimony, comprised nearly 700,000 words. Bristow made a 50,000 word extract. Then, by order of the President, he was told to cut the 50,000 words to 25,000, and, later, to 12,500. A short time ago the President called in Mr. Bristow and told him to cut the 12,500 words to 6,000. Bristow threw up his hands.

"I can't, Mr. President," he said. "It is down to the bone now."

"Why not?" asked the President. "You were an editor out in Kansas before you became fourth assistant postmaster-general, were you not?"

"Yes," said Mr. Bristow; "but even a Kansas editor has to have some language with which to express his thoughts." Washington Star.

Mills & Masters

JAS. MILLS, Mgr. RIVERSIDE, CAL.

RIVERSIDE NURSERIES, Riverside, Cal. Fullerton, Cal., Oct. 24, 1903.

Dear Sirs—It is with no small degree of pride that I point to the orange orchard that I set out in June, 1902, with stock from your nurseries. I am not acquainted with any orchard of similar age that has done so well, and is today so promising. This certainly speaks in no uncertain language of the character of the stock coming from your nurseries. Very respectfully, CHARLES CHAPMAN.

BY J. W. JEFFREY, LOS ANGELES

SPECULATING IN CITRUS FRUITS

There are a few yet remaining who honestly believe that oranges and lemons should be bought on the trees or in the packing house, at least. Or, as a last resort, the fruit should fall into the hands of a purchasing merchant not farther toward the market than the loaded car. We do not presume that any one imagines such a practice possible, or believes it has ever held in the disposition of a citrus fruit crop to any great extent in the past. But let us suppose the present crop was to be moved in full by the actual purchaser of the fruit. It must be admitted that it would be a speculative movement, and rightly so should the purchaser possess himself of the fruit by payment. Every speculative movement should be preceded by a still hunt for fruit at the lowest prices. This period of quiet purchasing should be continued as long as possible by the merchants in deference to their own interests. It would be to the buyers' interest to suppress all information that might have a tendency to stiffen prices, and they would certainly have all information that would indicate a lowering of prices and would offer accordingly. Under this system the grower would have all the stimulation of speculating between early and late prices, without the means of determining the possibilities of the trade, much less of its probabilities. It has been found impossible to even supervise the speculative tendencies of the country, much less to control them. The only means of control is the diffusion of market intelligence and the fruit growers under the home-selling plan would have no means of securing that. No matter what the necessities of the trade would be as to demand, or the exigencies of importation, the fruit farmer would be at the mercy of the buyers without his own means of securing reliable market information.

Speculation in farm produce is a close contingency. None but the alert may take part in it with safety. Brokers' exchanges publish the prices of speculation futures, or it is published for them, and even in this gambling in farm produce the producer has some information as to what the future value of his commodities may be. The elect are those who have by some hook or crook obtained information as to the range of supply and demand, the competition from other classes of produce, or, in a general way, the probable course of the markets. This information is not published. It is surpressed and the only recourse of the farmer is to supply his own information, which he cannot do unless organized. His safety is dependence upon the natural course of the markets, which do not fluctuate from unnatural causes. By selling his own goods in the open market he not only protects himself from his own speculative tendencies, but gets all there is on the level of a permanent trade.

In discussing home-selling, which is still a glittering ideality to many orange growers who were not in the business ten years ago, we have assumed that the purchasing merchant is honest, or that he pays cash upon delivery of the fruit. With all this he must in a large measure control prices or his speculative business cannot be conducted upon a safe basis. He must determine the margin between his offer and the probable course of the market. He must assume all risks of transportation, or delivery, and his offer is guided by his idea of what that margin should be, or the amount of the risk of delivery. He is a "bear" at this end of the line and a "bull" at the other, and works havoc with the grower here and the consumer there. There is nothing in the laws of supply and demand that appeals to him. The producer must be protected and the consumer cultivated, but speculation is the enemy of all this, and buying a perishable commodity in the field is the opportunity of neglecting the elements that lead to permanent and profitable business between the producer and consumer.

CALIFORNIA FARMS.

"There are 72,542 farms in California with an average size of 397.4 acres." says an article compiled from the California Promotion Committee. One thousand, four hundred and ninety-six of these farms are under three acres in extent; 5342 are between three and ten acres; 8236 are between ten and twenty acres. The larger farms are as follows: 13,110 are between twenty and fifty acres; there are 8067 between fifty and one hundred acres, and 13,196 farms between one hundred and one hundred and seventy-five acres. There are 4635 farms ranging from one hundred and seventy-five to two hundred and sixty acres; 8370 between two hundred and five hundred acres; 5329 between five hundred and one thousand, and 4735 forms more than a thousand acres in extent.

ORANGE GROWERS' ASSOCIATION.

At Redlands, last week, an association was perfected known as the Highland Independent Orange Growers' Association. The capital stock of the association is $10,000. The following are the officers elected for the coming year: D. R. Seely, W. F. Grow, Thomas W. Frye, F. A. Fletcher, John Cleghorn, R. E. Longmire, J. P. Linfesty, J. H. Bagwill and W. H. Marks.

Light rains have fallen in the northern part of the state during the past two days. The ground is now well soaked with water and farmers are busy seeding. In the southern part of the state the week closed with abnormally hot weather and drying land winds. At Los Angeles the weekly mean temperature was 10 degrees in excess of the normal and for several days the daily maximum ranged in the 90 degrees.

Drying land winds prevailed, which parched the soil and made irrigation as necessary in midsummer; water was in as great demand as at any time during the season, and places report streams lower than at this time last year. No rain has fallen since September, when light showers occurred; farmers are anxiously looking for good rains to soak the soil and put an end to irrigating.

Some sections report oranges as not coloring as fast as expected, while others state that the fruit is ripening fast, and picking and shipping have begun.

Dry plowing and seeding continue, but ranchmen generally are waiting for rain.

Stock is needing rain as feed in some sections is running low.

A NEW THERMOMETER.

J. P. Bolton of Fresno, Cal., has invented a new and very useful thermometer for use in orchards to announce the approach of frost. In using methods of preventing frost damage the one great drawback has been to know just when to smudge. The fruit grower often retires at night thinking everything safe, only to wake in the morning and find that frost has destroyed his entire crop. Then smudging is of no avail.

The Bolton Electric Alarm Thermometer is especially built to overcome this difficulty. The alarm attachment is so constructed that it can be set at any particular temperature that the operator may think damaging to his crop, and when the temperature reaches that point the alarm rings, thus giving timely warning to fire the smudges. The thermometer can be set at any distance from the sleeping apartments, where it will be able to make the most accurate registrations. The alarm can be placed at the head of the bed, or in any convenient place in the room to insure the awakening of the occupant.

Did you ever hear a man crack a joke while he was teaching a calf to drink from a pail? Send us his name; we want to publish it from the housetops.

FOREST RESERVES.

Messrs. Roth and Potter, who are experts of the United States Bureau of Forestry, in company with four other experts from the same bureau, will at once begin an investigation of the temporary forest reserves now in existence in Northern California, with a view to recommending those that ought to be made permanent. There are 12,000,000 acres of land included in these temporary reservations and the determining of what shall be included in the permanent reservations is considered of vital importance to the people of that part of the state; and in relation to future effect on agriculture and timber interests the decision touches the welfare of the entire state.

START IN LIFE ON THE FARM.

The young man who is thinking of leaving the farm for the city may learn when it is too late that while he may earn more in the city he cannot save as much as he could on the farm.

If his object is to secure a competence, he in nine cases out of ten will do it the sooner on a farm. There are more chances to spend money in the city than in the country, while the cost of living is higher.—Twentieth Century Farmer.

Careful observers of the times have not failed to make note of the many things in which the general government is assisting the states, and especially the farming classes. We have the anti-shoddy law, the pure food law, the appropriation to assist miners in hydraulic mining, laws for promoting irrigation, for the establishment of experimental farming, etc., etc. Now it is proposed that the general government shall engage in a comprehensive system of county road building. Uncle Sam is also looking for suitable lands in California which he may buy, on which to raise seeds to be distributed by congressmen to their constituents. A few years ago such paternalism would have been vigorously opposed.

The Santa Fe is surveying and will build a railroad from San Francisco to Eureka. Engineer A. G. Whitleck who is conducting the survey, in a report says:

"I find a solid belt of redwood extending along the coast from Sonoma county to Humboldt. It is not narrower than six miles wide at any point and in some places the forest tracts are twenty-four miles in width.

Santa Fe officials have estimated that the road will pay for itself in twenty years, and that the rich timber traffic will hold out another twenty years.

A scientist declares that a sunflower sucks up 145 pounds of water during its lifetime. Some philanthropic gentleman should sow a few pounds of sunflower in Wall Street.—Napa Journal.

LAND AND WATER

BY A. J. MCCLATCHIE, PHOENIX, ARIZ.

AMOUNT OF WATER NEEDED BY CROPS.

Knowledge concerning the amount of water needed by various crops grown in warm dry regions entirely by irrigation is a matter of great importance in planning irrigation enterprises and in calculating what can be grown with a given water supply. Data upon the subject are gradually being accumulated, and there will soon be little justification for the making of such miscalculations as have heretofore been made in some parts of the southwest. Records of the amount of water applied to various crops have been kept at the Arizona Station farm for several years, and the amounts used there are undoubtedly about those required to grow the same crops in other warm interior valleys of the southwest. In stating the amounts they are expressed in the depth of application of the water.

* * *

Grain crops, being grown during the winter while the weather is comparatively cool, and evaporation correspondingly low, do not require as much irrigation water as do the same crops in some cooler regions where they are grown during the summer. The amount needed varies somewhat with the soil and the winter rainfall, but three or four applications of water each to the depth of six to eight inches, or eighteen to thirty inches deep in all is usually ample to produce a good crop. Part of this amount is usually applied before plowing for seeding, and a satisfactory crop can usually be grown with less water by this procedure than by sowing dry in soil and applying all the water subsequently. If the seed be sown in moist soil, no irrigation is ordinarily necessary until the grain has covered the ground well; and consequently the surface does not become baked and give off water as rapidly as is the case when water is applied soon after seeding.

* * *

Alfalfa, in order to give the best results, requires the application of four to six feet of water during the year. This crop is especially well adapted to a region with a fluctuating water supply, as is the case with most localities depending upon a stream for its irrigation water. During the first few months after seeding alfalfa must be kept supplied with plenty of moisture in order to get the young plants started; but after a stand is secured water may be applied quite irregularly, the crop ordinarily varying with the amount of water applied, within certain limits. Alfalfa being very deep rooted, water may be applied freely during the winter when it is available in larger quantities than during the summer, and then may be withheld entirely during the latter season. Two feet in depth may be applied to advantage just before, or during the early part of the growing season, and then just enough applied between each cutting to keep the soil about the upper roots moist. To be sure, it is better to be able to apply the water more systematically, but if this cannot be done, there is no crop that will endure irregular irrigation as will alfalfa.

* * *

Root-crops, such as potatoes, beets, carrots and turnips, grown during the cooler part of the year require one and one-half to two and one-half acre feet per acre. If grown during the summer, a larger amount is necessary. The soil in which potatoes are to be planted needs the application of water to the depth of about eight or ten inches before plowing, and the growing crop should receive three or four irrigations, each of a depth of about six inches, the last after the plants have bloomed. Garden or sugar beets sown during winter will grow well without irrigation for a month or more after seeding, if the soil has been previously moistened by the application of water to the depth of eight or ten inches. After irrigation is begun they need to be kept supplied with moisture until the crop is well grown, the largest amount usually being required during May and June. If sown during the summer, they must be irrigated from the first.

* * *

Summer forage crops vary considerably as to the amount of water needed, corn, sorghum and related plants requiring less than cowpeas and other related legumes. Corn may be grown with two feet of water, and sorghum, Kaffir corn and Egyptian corn with even less. Cowpeas are a desirable crop for several reasons, but require too much water to be grown where the summer water supply is not abundant. Between three and four feet are needed to produce a satisfactory crop, and more may be applied to advantage if they are permitted to grow throughout the summer. Cotton, another southern crop, also needs a large amount of water to produce a full crop, four or five feet being consumed by the crop during its long season. In planning the culture of such crops that must be grown during the summer, it is important that the amount of water they will require be given due consideration and it also should be considered that in most regions water is more valuable during the summer.

Melons do not require as much water as the nature of the crop might indicate. While they require a large number of irrigations during their growth, the total amount necessary to apply to the crop is not correspondingly large. This is partly due to the distance between the rows, and partly to the rapidity with which the plants appropriate water put within their reach. The amount needed is between three and four feet if the crop is permitted to remain on the ground far into the hot weather of midsummer. Most summer vegetables require about the same amount.

Strawberries, needing as they do irrigation throughout the year, require the application of as much water as does any small plant. During much of the year in the dry interior valleys, they need irrigation about once a week and during the remainder of the year they need it at least once or twice a month, in all thirty to forty irrigations. The smallest depth that it is usually practical to apply each time is about two or three inches, making a total of over six feet for the year.

* * *

The amount of water required by orchard trees varies from three to five feet per year. For the benefit of those who are accustomed to thinking of irrigation water in terms of inches, it may be stated that the above amounts are equivalent to a continuous flow of one-sixth to one-third of a miner's inch per acre. It has been found by experiment at the Arizona Station farm that in the case of deciduous trees, the most, or even all, of this amount may be applied during the winter while the available supply of irrigating water is greatest. Where more convenient to do so, about three feet may be applied during the winter, and one foot in one continuous irrigation some time during June or July. But it is wasteful to make many applications of small amounts of water, as by this method only the upper part of the soil is wet, and the moisture soon escapes by evaporation without having reached the tree lower roots.

STOCKMEN, SEEDSMEN, NURSERYMEN

Your Catalogue or Booklet

We are headquarters for this class of work, having ample facilities by reason of large fonts of body and black letter in all the standard sizes; our presses and display type are the best and most modern that money could buy. Being familiar with the common and technical names of plants, and the literature of advanced horticulture and agriculture, we not only guarantee a superior quality of work, but accuracy and literary excellence in its arrangement and classification. In the matter of preparing copy our experience is at the service of all who favor us with their printing. Correspondence invited. You do not go to a blacksmith shop for watch repairing, nor to a tailoring establishment for farm machinery; then why should you trust your catalogue and general printing to firms inexperienced in this class of work.

BERMUDA GRASS.

Editor Cultivator: I notice in the last two issues of the Cultivator inquiries regarding Bermuda grass, and asking where seed may be obtained.

I have had considerable experience with this grass and I cannot understand how any sane person can recommend its propagation. About ten years ago three neighbors obtained some roots and planted them around their reservoirs to protect the banks. From this thoughtless beginning it has spread until now the great question is how to get rid of it. The birds and winds carry the seed and the grass springs up around the trees in the orchard where the cultivator cannot reach it, and it has to be dug out with hoe or spade, and then it is almost impossible to get clear of it. The grass is a creeping grass, full of joints which catch in the ground, and in digging it up if a joint is left a half-inch long it takes root. It is a wild grass. Stock will eat it when green and it grows about six inches high. When cut and cured it is almost worthless, being of about the consistency of chaff, so light that it can hardly be handled with a fork.

Bermuda grass, Canada thistles, Australian salt bush and salt grass ought to be in the same class, and to have my choice of a patch four feet square, planted on my ranch, I should choose Canada thistles, as the thistles can be eradicated, but the others cannot. I cannot conceive how any person can recommend Bermuda grass when he can plant alfalfa, clover, blue grass, timothy, millet—all good grasses that can be plowed up if you wish to change the variety. I have written thus strongly against Bermuda grass thinking it my duty to warn people against propagating such a wild and comparatively useless weed.—James A. Whitaker.

SEND SPECIMENS.

Editor Cultivator.—During the fall, my peach orchard was badly affected by some insect which punctured the tissues of the new growth and seemed to suck the sap. Later the leaves began to turn yellow and to fall off in large quantities. Now the trees act as if they are dying. Will you tell me through your paper what this insect is and what I shall do to rid my orchard of it, for unless I can get rid of it this season, I shall have no trees left.—J. F. D. Subscriber, San Luis Obispo.

Editor Cultivator.—I am exceedingly sorry that it is not possible for us to recognize the insect which is mentioned by your correspondent whose letter I return; consequently, it would be the merest conjecture to make comment upon it. If it is possible for your correspondent to secure any specimens of the insect which he thinks is occasioning the trouble we could perhaps give some satisfactory information about it. If they have entirely disappeared we can suggest nothing but that he watch for them and secure specimens as early as possible next season.—E. J. Wickson.

There are now attending the regular courses in the Agricultural Department of the State University, 46 students.

THE POTATO CROP.

The Pajaro Valley is one of the principal regions from which our potatoes come. At least it is one of the most productive in the state. This year, as a whole, the crop will run 80 per cent. of what it was last year. In this state, as in all others, one of the necessary crops is the potato crop, and when that is short it is keenly felt. From now, until all the potatoes are gathered, there will be, necessarily, a good deal of fluctuation in price. In the interior valleys the crop is lighter than was anticipated and this tells on the general market.

OLIVE PICKING.

Olives are coming to the packing houses in large quantities. There will be a big yield of oil, but as a whole, the olive crop is reported short of last season, owing to the smallness of olives. There is also much difficulty in pickling the crop so as to keep them. The San Francisco Chronicle is authority for the statement that a process has been perfected by a San Diego man by which the pickled fruit can be so prepared as to keep under all circumstances. He does not use any preservatives at all, the result being attained entirely by treatment of olive.

CUTTING RATES.

The fact that the Fresno raisin association is not selling its product as freely as its officers think it should, is giving them some uneasiness. The sales to date are some thousands of tons short of expectations. The cause of this condition of the market is found to be the abundance of outside fruit which is being marketed at reduced rates.

THE PRUNE MARKET.

The San Francisco Chronicle notes the fact that there is no improvement in the prune market. The large crop has prompted growers to let go their holdings at less than a three-cent basis, and this they are doing at such a pace as to over stock the market.

BANNER PRICE FOR LEMONS.

C. W. Leffingwell, jr., has received the banner price for lemons this year, This week a car of his lemons sold in New York for $1087 net. The fancy brought $5.87 per box. Two other cars within a week or so have netted Mr. Leffingwell over $900 each.—Whittier News.

A later car brought $6.87½ for the fancy grade, which is the highest price received for California lemons this year.

Johnson Grass.—A correspondent asks, "Is there a law in California prohibiting the sowing of Johnson grass?"

There is. Chapter 250, approved March 20th, 1903, provides that it shall be unlawful for any person to sow Halepense, commonly known as Johnson grass, on his own land, or on the land belonging to another, or on the highway, or allow the seeds to mature, if it is already growing on his premises or in the highway fronting his land. The penalty on conviction for this misdemeanor, shall be a fine of $100, or imprisonment in the county jail for a period of one month.

For a Christmas present nothing is better than a copy of the Cultivator.

The Gregory Packing company is erecting a large plant at Colton.

NO EXCEPTION

Last year we said the Tilton Apricot was a regular bearer. NEVER FAILS. This year is no exception. Every tree bore heavily; old ones as well as the newer planted orchards.

Fifteen Years' Test
and still the

TILTON APRICOT

Is a winner. Large, highly flavored, good color. In the dried fruits the Tilton won First Premium at the Great Central California Fair. Liked by canners. Original tree 18 years old near our nursery. Buy trees where you can get true to name buds from original stock from the Original Tilton Nurseryman. A thrifty lot of peaches and other deciduous trees.

J. W. BAIRSTOW, HANFORD, CAL.

Conducted by PROF. A. J. COOK, Claremont, Ca'.

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A. B. C. OF INSECTS
(Continued)

Predacious Insects.—Of the predacious insects, we have two very important families, the rounded familiar lady birds and the black quick ground beetles. We have had a good illustration of the first in the introduced species which have done so much for the fruit growers of Southern California. The Vedalia, all unaided, has looked after one of the worst pests of the citrus orchard, the cottony cushion scale. The Rhizobii are also doing immeasurable good in destroying the black and purple scale insects. It is a matter of common observation that the ordinary red ladybirds and the equally common red, spotted with black, forms, are constantly laying us under a great debt of gratitude in destroying the pestiferous aphids. These aphids are very destructive, and except for their natural enemies would involve the orchardist and gardener in tremendous expense in keping them from destroying his plants and trees. It is hard to estimate the enormous value which we annually receive from these ever present lady bird beetles.

The form of the lady birds is very characteristic. They are short and rounded and the antennae are very short—so short that they are usually concealed beneath the head and can only be seen upon very close examination. The grubs are also shorter than the same of most beetles. They also feed upon aphids and other insects. We have a native lady bird, black with a red spot on each of the elytra, which does great good. It even feeds upon the black scale. Prof. Marlatt, of the Department of Agriculture, has recently found in Northern China, which he thinks was the native home of the San Jose scale, a lady bird which is almost the exact copy of this last and which is known to science as Chilocorus similis, while our native one is C. bivulnerus. This hints at what is more than probable, that if we would find the native place of our most destructive insects, we would also be able to discover natural enemies that would hold them in check.

The other family of predacious beetles—the ground beetles—are very numerous, very active and very valuable. They are almost always black and are very quick and active. They are savage both as grubs and as mature beetles, and many a caterpillar and other insect pest falls victim to their rapacious appetites. They are especially valuable in ridding us of underground caterpillars like cut worms. At times, when we have the so-called army worm raids these ground beetles do immense good. I have seen a single grub destroy two or three great cut worms in two or three minutes, and their rapid growth is only equalled by their hungry appetites. One meal is hardly over before another is commenced. Here again, it would be hard to estimate the great benefit which we receive from these ground beetles.

* * *

The commercial beetles—blister beetles—are used, as is known, in case of disease. The Spanish fly, a species of Cantharides, is most used, though the blister beetles of our own or any country have this power to irritate which makes them valuable. They simply need to be crushed, moistened and bound onto the flesh to raise a blister.

It will be remembered that in our last number, we made a study of the greatest order of insects, the Coleoptera. We remember that they are biting insects with complete transformations, and take their names from the fact that their primary wings sheath the lower wings, which alone are functionally useful. Many, like Fuller's Rose Beetle and the lawn beetle or strawberry grub, feed on the roots of plants. Others, like this same lawn beetle when mature, and the many leaf beetles in both of their active stages, grub and imago, feed on foliage. Many of the weevils also feed on foliage. Fuller's Rose Beetle not only eats leaves but does great harm eating the leaves of plants. Again, many of the beetles like the Plum Cirvulio, bore into, and feed on the fruit. Still other insects, like the carpet beetle and the bacon beetle, feed on and destroy articles useful in domestic economy. So great is this order and so numerous are the destructive species that we can give only a brief description of typical forms and suggest methods to cope with these insidious enemies.

* * *

The Weevils.—There are several families of beetles which have their head prolonged into a more or less snout or rostrum. These are usually referred to as weevils. Fuller's Rose Beetle belongs here. This is a formidable enemy. The footless grubs destroy the roots of strawberries, raspberries, roses and the roots of other rosaceous plants while the mature beetles destroy foliage and are especially annoying to our citrus growers, as they feed upon the buds of newly budded trees often doing great damage. The Plum Circulio destroys the fruit which gives them their name. A large weevil bores into our yucca and is quite common here. However, as the yucca is of little importance, this weevil would fail to interest most of us. The weevils can be destroyed by the use of Paris green, but they are slow to succumb and do a great deal of damage before they get enough of the poison to be fatal. Hence this method has failed to prove satisfactory. Most of the insects of this group have the curious habit of falling to the ground when they are jarred. Hence we can often destroy them by jarring them onto sheets and then killing them. Fuller's Rose Beetle has no wings and so it can do damage only by crawling up the plants or trees which they infect. Cotton about the tree fastened by a strip of cloth and left fluffy will prevent their passing up the trunk and so may well be used in our citrus orchards where we are budding over trees.

* * *

Leaf Beetles.—The leaf beetles in a general way closely resemble the ladybird beetles, though usually they are longer. We remember that the ladybirds are nearly round. These are usually more or less elongate. The antennae of these are also plainly seen, while the antennae of the ladybirds are visible only upon very close inspection. The potato and elm leaf beetles of the east are illustrations of this formidable pest. Most of us will remember the little striped cucumber beetle. We have one here of similar form and size, a little greenish yellow beetle with four black spots on its wing covers. It is known to science as Diabrotica soror, and we may call it the twelve-spotted leaf beetle. Many of these leaf beetles are very brilliant. A deep blue one is very common here on the milkweed. While we have many species here, I know of but the one just referred to that is destructive. This little twelve-spotted species works on melons, cucumbers and other vegetables. These insects are the more pestiferous as they feed both as grubs and imago. In some cases, however, like the cucumber beetle, the grubs feed on roots rather than on leaves.

It hardly need to be said that Paris green or other kindred poisons is the great panacea for these pests. The root forms can best be killed by bisulphide of carbon, as can also the root-eating weevils.

* * *

The Borers.—There are two great families of beetles which are exclusively borers and are very serious pests to our forests, fruit and ornamental trees. The common borer of our deciduous trees belongs to this last family. So far as I know, this is the only borer that vexes our orchardists in this state, if we may except the peach borer which is a moth, and not a beetle at all. The remedy against these borers is that of prevention. We wash the tree trunks with a strong soap solution, or better still, apply soft soap in liberal quantities, in the early spring at the time of egg-laying. This seems offensive to the mother beetle and thus she is prevented from laying eggs. The big-headed borers work but one year. They usually tunnel just under the bark and usually under the southwest side of the trees. The round-headed borers, on the other hand, may bore for three years before changing to pupae and bore deeply into the wood. These are the beetles that often do such damage to timber.

* * *

The June Beetles, or White Grubs.—Many of us know too well the common June beetle which ruins our lawns and blights the strawberry plants. It is the grub that does the mischief here and we often refer to them as white grubs. The beetles also do damage by eating leaves after the grub has done its work. These are so abundant that it is hard to suggest a good remedy. Plowing up and reseeding the lawn or strawberry beds is about the only satisfactory method of dealing with these pests. Our May or June beetle here in California also lays her eggs in the manure of the stable and the grub seems quite satisfied with such diet. Fertilizing the lawn or strawberry plantation by this effective manure often introduces these grubs and results in great destruction. A smaller insect of this same family, which is rich brown in color, eats on the apricot leaves and doubtless works on the roots of plants while yet in grub state. These beetles are often numerous and at times very destructive. They bury under the trees by day and come forth with the darkness to eat foliage. Whenever we see our deciduous fruit trees with ragged leaves in May or June, we are pretty safe in laying the blame at the door of these little bright brown beetles.

* * *

Wire Worms.—The wire worms, grubs of the spring beetles, are destructive in California, working on the roots of alfalfa and fruit and other trees. It is hard to combat these as they are so common. Bisulphide of carbon might help in the orchard, and if we cannot drown them out by flooding the alfalfa meadow, it may be wise even to plow up and reseed. It will depend upon how serious is the damage wrought by them. I think that these wire worms have done more damage in California than any other beetle. If Fuller's Rose Beetle continues in its present role it will soon be a close second, even if it does not stand at the head.

* * *

JOHNSON AND BERMUDA GRASS.

Mr. Lorbeer of Pomona sends me a grass and wishes that I should tell what it is. I think the grass sent me by Mr. Lorbeer is Johnson's grass, though it is impossible to always be sure of a tuft of grass where there is no flower stalk developed. The Johnson grass was introduced, I think, from Turkey into South Carolina by Governor Means. Afterwards Senator Johnson took it to Alabama, hence its common name. Its scientific name is Andropogonhalepensis. It is one of the sorgums, hence, as we should expect, has broad leaves. Under favorable conditions, it grows several feet high. Bermuda grass, Capriola dactylon, has very narrow leaves, and scattered flowers on the flower stalk. The color is dark, almost blue. It, like the others, when it comes, comes to stay. In a lawn, it usually fights the blue grass until the latter gives up and succumbs entirely. It is scattered by seed but more by scattering the under-ground stems. It also makes good feed both as hay and pasturage, but the fact that it is so hard to get rid of also discounts it. We greatly wish that neither of these grasses had ever been brought to California. They are, however, everywhere and the only way that we can ever be rid of them is for every body to say and act, "fight." All these grasses are called "Devil grass." We see why, like his Satanic Majesty, fight, as we may, they never say quit.

Professor Shaw, of the State University, states that so far as he knows there is no virus known that will kill squirrels.

The Garden Spot of California

Why spend your time irrigating desert sand when choice productive land requiring no irrigation may be had for little money. Land located where semi-tropical life may be enjoyed in fulness, in a well settled and cultured community; handsomely wooded and watered, living springs on the place, scenery and climate are unsurpassed, no frosts, no winds, no malaria. All that is desirable for a happy and prosperous home for a tourist or wage earner. Terms easy. Vines or fruit trees set and cared for for two years to non-residents. Best county in the state for sure and large returns. Send today for book, free. It tells you all about where to raise all kinds of fruits, cereals, vegetables, poultry and stock. Address

Hayden, Park Co., 422 Laughlin Bldg., Los Angeles, Cal.

GO TO GARDENA

Where the alfalfa grows so luxuriantly, giving from 6 to 8 cuttings per year, and producing when fed to cows a superior product of milk and butter—the secret—there being no alkali to detract from the purity of the milk, as demonstrated by the noted Strawberry Brand of Butter made by Mr. Davis of Gardena. The success of our Chicken Ranches depends upon having green alfalfa as a food product in the production of eggs at a time of the year when the dry ranch farmer has no green feed to make the hens lay. Our small alfalfa, dairy and chicken ranches are making good livings.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

So. Hill Ave. Pasadena, Cal.

Coast News and Notes

BY R. A. DAGUE, COR. SUTTER AND SANSOME STS., SAN FRANCISCO

HORTICULTURE.

An olive grower of Madera harvested forty tons of fruit this season.

Three large orange packing houses at Exeter, Tulare county, are busy packing and shipping oranges.

Recently a solid train of forty-two cars loaded with walnuts went East from Southern California over the Santa Fe.

P. L. Schlotterback, of Sebastopal, is preparing to plant out 2000 walnut trees on his farm, which is well adapted for walnuts.

There is a lively movement inaugurated among the women of Sonoma county to plant trees along all the public roads of the county.

E. H. Kimble, of Tulare county, will send some Japanese persimmons to the St. Louis Exposition, some of which measure eleven and one-half inches in circumference.

Mr. Lindsay, of Tulare county, has been for a week or more shipping fifteen carloads of oranges daily, and will keep up that pace for quite a while. The fruit is of a fine quality.

The Hoyt Tree Support Company, one day last week, shipped 250,000 supports to Riverside. This is the second shipment to that place by this company within the past month.

Major Berry raises a note of warning to the grape growers of Yolo county. He says a vine disease has crept in there and it is not phylloxera. Individuals cannot cope with it. It must be stamped out by a general co-operation of the growers.

Prof. Fowler says: Professor Clark's remedy for the codling moth is effective; i. e., a mixture of lime, sulphur and salt. It must be applied when the weather gets warm and when the insect has taken the head of the cocoon preparatory to coming out.

The prune growers of Oregon have taken steps to organize a co-operative prune insurance company, as they claim the old companies have been charging them too much for insurance. They have been paying $2.50 per month on each $1000 worth of dried fruits.

In order to avoid duplication at the St. Louis Fair, Southern California counties will make specialties a feature. San Bernardino county will make a specialty of minerals, Santa Barbara of olive oils, Ventura of beans, Riverside irrigation and citrus fruits, Orange county, sugar and small fruits. San Diego, raisins, silks and minerals, while Los Angeles will present an all-round general display.

AGRICULTURE.

Hollyberries are ripe in the Capay valley.

The sugar crop of Cuba this year will be 1,230,000 tons.

The cotton boll weevil has caused a loss of $250,000,000 in Texas alone.

Richard Chattan, near Visalia, is preparing to plant 1600 acres to wheat.

Dr. H. B. Crocker, of Healdsburg, will plant 1200 walnut trees this season.

About 350 carloads of sweet potatoes have been, this season, shipped from Merced.

The Pasadena city sewer farm this season has grown about 50,000 pounds of English walnuts, worth about $6000.

Santa Ana shipped the first celery that reached Chicago this season. The shipment consisted of fifteen carloads.

The potato crop of the Pajaro valley this season is estimated to be about 80 per cent of what it was last year.

More than 50,000,000 pounds of India rubber was imported into the United States last year. Its value was about $30,000,000.

The Spanish peanut crop of 1902-03 is stated to be the largest ever grown, amounting to between 50,000,000 and 60,000 bags.

There is an alfalfa boom in Tulare county. Farmers will put out a large acreage notwithstanding seed is fourteen cents per pound.

The value of the corn crop in the United States in 1899 was twenty-five millions greater than all of our iron and steel industries combined.

The honey crop was heavy in the east this year, and the weather prophets say that is a sign of a long and severe winter.

Sweet potato growers of Tustin, Westminster, Fullerton, Santa Ana and other localities of Orange county, have formed a co-operative association.

Only Emperor grapes, from Fresno, brought satisfactory returns in New York. They brought about $2105 per carload. Other grapes sold for $1100.

J. W. Barbour, of Kings county, is preparing to seed 3,500 acres on his ranch and thinks that 25,000 acres will be put in grain in the lake bed this winter in that county.

The honey output of Acton this season amounted to 185,076 pounds. Two carloads went to Los Angeles, two to Portland, one to San Francisco and one is yet unsold.

The Colusa Sun insists there should be no talk about a "citrus belt." Oranges grow all over the Sacramento valley except in the "spots" where frost sometimes comes.

S. Richardson is preparing to cut up his farm of 493 acres, near Tulare, into five-acre tracts and put it on the market. Meanwhile he will farm it to alfalfa.

During the past two months over six carloads of sweet potatoes have been shipped from Modesto county. They sold at $1.00 per box or for a total of $80,000.

Reports from different points in Northern and Central California, are to the effect that grass is making a splendid growth and the dairy prospects are bright.

Long years ago a little band of Jesuit padres at San Gabriel planted the first cuttings of grape vines in California, and from these few chance cuttings brought from sunny Spain has grown the wine industry of the state.

The potato crop is very large this year in Washington. Buyers are offering 40 to 60 cents per 100 pounds, but growers demand 75 cents. They say if they cannot get that they will hold them until spring, when they will be worth $1.00.

A mathematician has computed for the Call that, at 160 acres apiece, the 100,000,000 acres of irrigable land, which may ultimately be brought under government reclamation works, will support 625,000 families, or, say, 3,125,000 people.

Government statistics show that the bug family in the shape of pests destroys fruits and crops in the United States each year to the amount of $358,000,000. Of these the San Jose scale and apple worms costs the country $10,000,000 annually. Grasshoppers, potato bugs, the cotton worm and chinch bug, are the other chief destructionists.

Under direction of the Agricultural Department of the State University, spraying of the orchards in Monterey and Santa Clara counties was done from April 20th to September 15th. Fifteen hundred trees were treated. They ranged in age from 5 to 20 years. The ravages of the codling moth were unquestionably greatly diminished, as shown by the good fruit gathered from those trees.

Coast News and Notes

CONTINUED

The total acreage in fruit trees in Santa Clara county as shown by the assessor's books, is not less than 56,000, and in vineyards about 6000; the acreage in berries and small fruits is 1200; in vegetable gardens 500, and in flower and vegetable seed farms 3000. Between 300 and 400 acres are planted in potatoes, and the wheat acreage is 10,000; that of barley 12,000; and of hay 30,000.

LIVE STOCK.

England annually imports $30,000,000 worth of eggs.

Dressed turkeys sold in San Francisco for Thanksgiving, at 35 cents per pound.

This country is a great producer of coal, but our eggs and poultry are $60,000,000 more valuable.

D. H. Fallen this summer purchased in Nevada, for Clabrough & Co., the San Francisco butchers, 40,000 head of sheep.

Mrs. Mary Stewart, a wealthy and experienced dairy woman, is establishing a dairy at Red Bluff, to cost $10,000.

Joseph Putnam, of San Jose, has recently bought a 400-acre farm near Visalia, and will stock it and do a dairy business.

Petaluma shipped to San Francisco for the week ending November 17th, 25,622 dozens of eggs and 576 dozens of poultry.

A farmer of Pixley says he has found that cats are the most efficient squirrel killers. He has rid his farm of squirrels with cats.

Some Kansas parties with capital have located a creamery at Ferndale, Humboldt county. They expect to handle the entire product of the county.

Charles McAllister, a sheep king of Washington, says that fifty per cent of the sheep of eastern Washington and Oregon will perish this winter from lack of feed.

A successful horse trainer says, "Pet your horse and have some sugar and an apple in your pocket. Make a beggar of your horse, and your work of training is half done.

The statement is made by reliable parties that at least 50,000 sheep are being frozen to death in Wyoming. They were overtaken by deep snowdrifts before they could be removed.

Lompoc valley comprises about 13,000 acres. It is rapidly becoming a dairy section. It is estimated that more than one thousand cows will be daried there next year than during this year.

The Willows Journal, discussing the bacon question, says: "Twenty cents per pound for bacon sides and fat hogs selling less than five cents per pound. Here is a margin that should encourage our pork producers to go into the manufacture of bacon."

The movement to organize a Poultry Association started at Santa Paula, but is spreading. A branch association has been formed in Petaluma. The officers are Henry Graff, president; H. D. Pressley, secretary; J. Johnson, treasurer.

A late report of the Woodland creamery, shows that for every 100 pounds of milk delivered, four and a half pounds of butter were produced. For the year ending November 1st, $87,000 were paid out for milk. Mr. Gibson delivered milk from 56 cows, and was paid $4184.60. Mr. Bemmerly delivered milk from 40 cows and received for it $2859.45.

The people of Yolo county are beginning to see value in the tules that grow so profusely there, on low lands. Recently there was quite a demand for them from Japan and China.

MISCELLANEOUS.

A Rochdale co-operative store is to be started at Woodland.

The scientific professors now say there are 200 kinds of mosquitoes.

The peanut crop of Orange county this season will be about ten carloads.

E. L. Flint, of Auburn, California, died on November 25 from ptomaine poisoning from canned meat.

A vein of coal, two feet in thickness, has been struck 25 feet below the surface near Vacaville.

Mrs. E. Warren, of San Francisco, was recently poisoned by eating canned beans.

A quarter of a million dollars will be expended this winter in improving the Santa Cruz beach.

Three years ago California had less than 100 automobiles. Late reports say there are now over 2000 in use in the state.

Sixteen hundred acres have recently been purchased north of Visalia and will be occupied by a colony of Armenians.

The owners of 870 lumber and shingle mills of Washington have formed a rust, and will advance the price of lumber.

Louis Weber of Daunt, Tulare county, has some fine samples of dates, of his own raising, that he will send to the St. Louis Exposition.

The California Promotion Committee has on file about 60,000 letters from people who are interested in this state and think of locating here.

Santa Barbara will exhibit a crawfish at St. Louis, that measures thirty-seven and one-half inches in length and weighs eighteen pounds.

Los Angeles county has contributed $23,000 for making exhibits at the St. Louis Fair, and Alameda county $20,000. These two counties lead all others in the state.

There is a general reduction of wages throughout the country. On November 23rd the wages of 30,000 workers were reduced by the Fall River, Mass., cotton mills.

A new veterinary and bacterialogical laboratory is being fitted up in the agricultural department of the University where germs and fruit pests will be experimented upon.

The Washington State penitentiary has a surplus of 1,000,000 grain sacks on hand, as a result of the shortage of crops in that state. In the last eleven months the prison turned out 1,300,000 bags.

Commissioner-General Sargent is in favor of building a commodious immigrant station at San Francisco patterned after Ellis Island, and Senator Perkins has introduced a bill providing for such a station to cost not over $200,000.

Professor Fowler at a late Farmers' Institute in discussing the Rochdale co-operative system said, "one of the greatest benefits of the Rochdale system is that it teaches men and women the value of co-operation. Sooner or later the principle will be applied to production as well as distribution."

On November 12th Frank Leslie of New York, issued a "California edition," at the instance of the California Promotion Committee. It contains many beautiful illustrations of California orchards and other scenes, as well as highly interesting articles by Hamilton Wright, secretary of the committee, and others.

The U. S. government has established a retail grocery store in Washington, D. C., at which samples of pure food articles from foreign countries will be sold. These samples come from imported goods taken by the government for analysis. Those found to be pure are later sold to any person wishing to buy.

C. H. SESSIONS, ASSOCIATE EDITOR

ANSWERS HIS OWN INQUIRY.

Ed. Cultivator: In 1902, October 18th, my heifer was fresh. She is now giving about three quarts per milking. I milk her only once a day. I have had her up to the two and a half gallons per day in spring, on green feed. She gets only hay and water now. She will be fresh about the first of January. She has more than paid for herself and feed, in butter alone. It is needless to say that she is a Jersey and a thoroughbred at that. "Is she a paying cow from a Jersey dairyman's standpoint?" First cost was $50. —Subscriber.

I should think your correspondent, "Subscriber," answers his own query by the facts stated in his letter. As he calls his thoroughbred Jersey a heifer, the inference is that she has had but one calf. If she paid for herself (costing $50), and for her feed in the first year of milking, she is certainly a paying cow from a Jersey dairyman's standpoint, as she must have brought in $80 in the year to gross the above amount, let alone "to pay" such a profit. Again, if she gave 2½ gallons or 20 pounds milk this spring when five or six months in lactation, she is certainly a most promising heifer, as the yield indicates a good flow at flush, coupled with persistency. Any heifer that gives 20 pounds at flush with first calf, of good quality, is, while not phenomenal, a good one, and stands a strong chance to develop into a four-gallon cow. Such a yield, coupled with persistency, stamps this heifer as decidedly a paying proposition in my judgment.—C. W. Leffingwell, Jr.

WHAT ANGORA GOATS CAN DO.

I will attempt to tell a little I have learned about goats, in connection with getting a stand of timothy and clover on fresh brush land, without stirring the soil, says S. S. Brooks in Rural Home.

During the month of July and August, 1900, a hired hand and I cut all the sprouts and small saplings from a 50-acre field. We felled them all in one direction; the trees having been previously worked up into railroad ties and cordwood. The brush was left lying on the ground until the following November. During a dry, windy time, we set fire to the brush and cleaned it and the leaves and young sprouts out pretty nicely. In February, 1901, I sowed timothy and clover on the bare ground; but the hot, dry winds of the following summer burnt it out almost completely. I sowed the same piece again in 1902, getting a splendid stand. Owing to scarcity of labor I could not keep the field sprouted, and last year caught me with as large a stand of sprouts as grass.

I came to the conclusion that, if there was any money in goats, I was certainly situated about right for them. So, last spring, I purchased some high grade Angora goats; remodeled the fence and turned the goats into pasture on the field. So far, I have had no trouble keeping them in this field. They have eaten some grass, but their success in killing weeds is far beyond my expectations, as well as many others who have visited them.

I think I make no mistake when I say that their work during the summer has done considerably more damage to the brush than a close sprouting could have done. Their hair, last spring sheared only 3½ pounds each, on account of their being so thin. They are fat and happy now, and I will try to keep them so hereafter.

CATTLEMEN'S PACKING PLANT.

The scheme of getting the stockmen of the West to put up their money to the extent of $5,000,000 to erect a large packing plant is not meeting with quite the success anticipated by its promoters. Many of the stockmen argue that they can not see where any profit could accrue to the stockholders when the dividends earned are used to bring up the price of cattle, or the increased price obtained for cattle is used in paying dividends. They say this is but equivalent to the very simple and unprofitable procedure of taking coin out of one pocket in order that it may be dropped into another. There are other stockmen who are willing to shine in the directory or any other conspicuous position, provided it costs nothing. If the luster from the use of their names can add to the success of the undertaking, they are willing to furnish the names, but without any untying of the sock leg where they may be carrying a trifling surplus of coin. Some of these gentlemen are occupying high positions in cattlemen's circles, and seem content for the burden of the situation to foist itself upon the man in more moderate circumstances. The latter individual is standing expectantly with his eye on the indicator waiting for some evidence that the big man is going in good and strong before he casts his bread upon the troubled waters.—Kansas City Star.

PASTEURIZING MILK.

Dr. D. E. Salmon, chief of the bureau of animal industry, has for a long time been known as an advocate of pasteurization. In a recent interview the doctor said:

"Among the medical fraternity the opinion seems to be extending that the digestibility of milk is apparently impaired by the process of pasteurization. Subsequently, although the change thus made in milk will not be great, the fact stated leads to a decided preference for milk which is known to be so produced as to need no pasteurization. Although establishments which produce milk of a high degree of purity are now increasing, and natural milk from such sources is preferred to all other, the supply of milk of such quality is comparatively insignificant, and pasteurization is, therefore, still resorted to upon a large scale as a precautionary measure, where the history of the milk is unknown and the presence of objectionable germs is believed to be probable. Those who are able to obtain milk of an entirely satisfactory character in its natural stage do not resort to pasteurization. But the great majority of consumers are obliged to depend upon the general market supply, and many of them regard the protection afforded by pasteurization as of more importance than the slight loss of digestibility which may result from the process.

"Too much of a good thing" was not said about cleanliness in the dairy barn.

The cut used in connection with our article on pasteurizing milk comes from G. G. Wickson & Co., who have furnished nearly all the pasturizing plants supplied to dairies on this coast. The simple and inexpensive construction of the plant renders it desirable.

Anyone can build up a good dairy herd by buying stock whose performance is known. To breed such a herd is a vastly different proposition. The former requires money, the latter, brains.

F. F. Pellissier is putting in a skimming station at Los Nietos.

DAM—Mamie Clifden Judith, 43191. Private record of 72 lbs. in 30 days. Average test, 4.2.

Mrs. M. D. E. Sherman - Fresno, Cal.

IT PAYS TO HAVE A U. S. SEPARATOR

It is the best money-making and money-saving machine a dairyman can have.

It makes more money by getting more butter-fat out of the milk.

It also makes more money by leaving the cream in such fine condition, that the butter made from it takes the Premiums at the Fairs and elsewhere. If you do not believe it, read the following letter:

$65.00 U. S. SEPARATOR EARNS $53.00 IN PREMIUMS FIRST SEASON.

SPRINGFIELD, ILL., Oct. 31, 1903.

At the State Fair this fall I took the two Blue Ribbons on Pail and one on Print, the **White Ribbon and Sweepstakes on Dairy Butter.**

I use a United States Separator (No. 8, $65.00) purchased this year, and my premiums amounted to $53.00. Quite a help in paying for my Separator. It is needless to say I am well pleased with it, and find it profitable to have a U. S. Cream Separator.

MRS. W. M. CORRINGTON.

We find by reference to our list of premiums paid on Dairy Exhibits at the Illinois State Fair of 1903, that Mrs. W. M. Corrington received premiums amounting to over $53.00 in that Department, as stated above.

W. C. GARRARD,
Sec'y Illinois State Fair.

The above is only additional proof of what thousands of dairymen all over the country are daily finding out—that

In order to make the most money out of cows, it is necessary to have a U. S. Separator.

Illustrated catalogue free for the asking.

We transfer our separators from Chicago, La Crosse, Minneapolis, Omaha, Sioux City, Hamilton, Ont., Montreal, Sherbrooke and Quebec City. Address all letters to

Vermont Farm Machine Co., Bellows Falls, Vt.

PASTEURIZING MILK

The discussion which has arisen in some of the larger cities of this state, between dairymen and city health officials, has created an interest in the method of preserving milk in a healthy condition and eradicating, as far as possible, all opportunity for germs, or spores, to find lodgment in the milk, or the vessels in which it is preserved. For some time it has been conceded by authorities well qualified by experience and tests to give opinions, that the pasteurization of milk is of the utmost importance. The health of the community depends much on the purity of the milk it consumes, as on the water it drinks, for it is a well settled fact that infectious diseases are carried through the channel of the dairy from the cow to the consumer, and that typhoid fever, diphtheria, anthrax and tuberculosis find their most energetic life force in the unclean milk we use.

There are many conditions which may create bacteria and favor its growth; among which the most common may be recited as follows:

At the time of milking contamination may arise from the animal, the milker, or unclean methods of milking. All bacterial diseases affecting the udder of the cow must add large numbers of bacteria to the milk. Then the animal being kept unclean, and this is usually the case, will materially influence the number of micro-organisms. The hairy coat harbors dust and dirt, and the mud and filth usually seen on the hinder quarters of cattle being at or near the temperature of the body, is an all-perfect environment for the growth of the putrefactive bacteria. The milker also is a source of risk. His hands and the clothes he is wearing carry harmful and disease germs to the milk.

Then too, the habit of moistening the hands with a few drops of milk before milking is one of the most common causes of infection. The condition in which the barn is kept will have much to do in creating bacteria and spores, for it has been proven conclusively that uncleanliness in the barn is a source of pollution, for the dry air of a dairy barn is loaded with bacterial life, and sanitary cleanliness is almost unknown in the majority of dairies. Unclean milk cans and milking utensils add their quota to the bacterial contents, and in the summer months any delay in transit affords opportunity for the rapid multiplication of the enormous number of germs present.

In order to obtain a clear and comprehensive idea of the materials employed in an up-to-date dairy, supplied with all the essential equipments for the healthful handling of milk, an examination of the Belle-Vernon dairy was made this week and the statements herein contained find their basis on information obtained from the management of that mammoth plant. All up-to-date milk repositories may be provided with as extensive equipment as the Belle-Vernon—But it is doubtful. One thing is certain, however, and that is, if they are, we would have less sickness and fewer deaths in the community.

The method employed in caring for the milk when it comes to the repository is to deposit it in tanks which have first been thoroughly clarified to take out all sediment; then pasteurized in a tank which had run through it a steam jet, or force, of one hundred degrees, sufficient to kill every atom of life which might find its way into the tank or the milk. The second tank through which the milk passes, cools it down with water to eighty-five degrees, and a third tank cools with brine to thirty-eight degrees—thirty two degrees being freezing point. All this clarifying and pasteurizing is done inside of half a minute.

In this connection it should be noted that the brine tank is used for circulation and the force with which the brine is thrown through the pipes is so great as to exceed the strongest force of steam—being thrown by a pressure of 100 pounds.

The cans and bottles in which the milk is conveyed to and from the repository, are first treated to a wash in lye; then run through steam condensers whose heat is so intense as to kill every vestige of sporatic or germ life which might have found its way into the vessels.

From the steam washers these vessels are removed to a cooling room where the temperature is below thirty-six degrees, and in this room the bottles are filled and from it loaded into delivery wagons and conveyed to consumers.

It will be observed here, then, that the managers of this dairy have learned that the conditions which create absolutely pure milk; that is, control the life of bacteria, are temperature and time. "At 165 to 185 degrees," says Mr. Sessions, "very little if any bacterial life multiplies. The heating process is the essential feature of effective pasteurization, rapid and thoroughly cooling is nearly as important. Pasteurization does not kill the spores of bacteria which may be in the milk, and a few of the highly resistant species usually escape so that it is important to prevent the germination of this organismal residue. Cooling will do this and thus increase the keeping power of the milk. Authorities say: "If hot milk is cooled very quickly its keeping properties are increased, as any bacteria which might still be present are either killed or much weakened by the sudden change of temperature." This is why the milk goes through the sudden change of temperature as it is forced through the various tanks referred to.

The most productive sources of disease in milk, if it leaves the dairy in pure condition, is carelessness in the home or workshop where it is delivered. Many times water is added to increase volume and unless this is thoroughly boiled (which is seldom the case) it adds to the bacterial contents of the milk, its own quota. Then in small homes where milk stands for several hours, usually uncovered, pollution is unavoidable. It is here that germs get their start, and we opine, quite as frequently diphtheria is germinated in the vessels where the milk stands exposed to dust and heat, as from any can in the hands of the dairyman.

But one thing is certain, if the sentiment which the health officers in this, and other cities, is creating in favor of pure milk, clean bottles, and clean vessels at home, shall become so strong as to revolutionize the present method of handling milk as it is generally handled, it will have answered a very salutory purpose and the community will be vastly the gainer thereby.

PEDRO'S MATILDA PRIMROSE, 165848..... Heifer with first calf
- Primrose Handsome Pedro, 46966.....
  - Pedro, 3187 — Sire of many tested daughters
  - Rioter's Lorne Primrose, 88583 — Test 18 lb., 15 ounces
- Pedro's Mattie, 128153
  - Pedro, 3187
  - Marjoram's Matilda 77944 — Test 19 lbs., 16 ounces, granddaughter of the great Marjoram

We make it a rule of the Lemonita Herd to raise no bull calf from a dam which has not made a record of 400 pounds of butter in a year. The dam of this calf being just fresh for the first time, we can form no idea of her merits as a performer; but the calf's pedigree is so exceptional that we dislike to kill it, and will sell it cheap to someone who will raise it and take his chances on its turning out well. The dam is rugged and hearty and promises well; the sire is the best proven sire in Southern California. This calf is reasonably sure to be good enough to grade up any average dairy herd, and should not be sacrificed. For price address C. W. LEFFINGWELL, JR., WHITTIER, CAL.

LOSS IN SKIMMING.

A. W. Trow of Glenville, Minn., thus writes of his experience in testing the skim milk as it comes from the separator of over thirty different creameries, and the average loss of those tested is 7-1,000 of 1 per cent. A few were found that skimmed down to 2 and 3-100 of 1 per cent. Taking 3-100 as a standard of good skimming, there would be a useless or an avoidable loss of 4-100 of a pound of butter fat for every hundredweight of milk separated. The total loss to a county like Freeborn by imperfect skimming amounts to about 150 to 200 pounds of butter fat per day. Although this does not seem a great loss for a county manufacturing so large an amount of butter, it nevertheless represents a grand total of about $12,000 in the course of a year.

From extensive observations it is the opinion of those associated with the dairy department that the creameries sustain their greatest loss in their skim milk. There is not a place about the creamery that will bear closer watching. Separators should be kept in balance, run at rated speed, milk properly heated and extremely heavy skimming avoided. The skim milk should be frequently tested and a daily record of milk kept, with amount of butter made each day from the same not only as a matter of record, but to keep in close touch with the yield. It is as necessary that the butter maker know his yield of butter as that the miller know his yield of flour.

BOTS IN HORSES.

Editor Cultivator: I see in your last issue an inquiry from A. A. as to a cure for bots in horses. For ages there has been many theories concerning these little pests, and many valuable horses have died for want of relief. Let me give your readers an "old fogy" remedy that I have tried many times in the last thirty years, and have never seen it fail to relieve one time.

There is no danger in its use except that a heavy dose might cause a mare to cast her foal.

Take oil of Tansy, 1 oz., very warm water, one pint. Drench the horse with the above prescription, and repeat in twenty minutes if necessary. The horse will be relieved very shortly, the bots killed, and he will be ready for work.—J. D. Carson, Pomona.

BUTTER AS A MEDICINE.

Butter is so common a commodity that people use it and scarcely ever think what wonderful value lies at their hand in the parts of dainty yellow cream fat, says the American Cheesemaker. Of course, they know that it is useful in many branches of cookery, and that without its aid the table would be bare of its thinly rolled bread and butter, its delicate cakelets, and its other usual accessories. Beyond these uses the value of butter is a thing only vaguely thought of.

But this delicate fat is as valuable as the dearer cod liver oil for weakly, thin people, and doctors have frequently recommended the eating of many thin slices of bread thickly spread with butter as a means of pleasantly taking into the bodily tissues one of the purest forms of fat it is possible to get.

Butter is a carbon, and all excess of it is stored up as fat in the body. It gives energy and power to work to those who eat heartily of it. So it is not economy at table to spare the butter, even to the healthy folk. For any one afflicted with consumption, butter cookery, if plenty of fat can be digested, is one of the best ways of curing the disease, if it is in its early stages, or of keeping it at bay if advanced.

DIFFICULT TO SAY.

Editor Cultivator: What can one afford to pay for whole barley to feed to hogs selling at six dollars per hundred. Barley to be fed with pie melons or pumpkins?—Subscriber.

The price at which barley is selling makes it difficult to tell what one can afford to pay when fed to hogs. Hogs vary a good deal in fattening quality as in market price. But to finish for the market and finish quick there is nothing better than barley except corn mixed with a little oil cake.

VALUE OF SKIM MILK.

In response to an inquiry by a correspondent of the Orange Judd Farmer, Dr. Wiley of the United States department of agriculture reiterates his opinion that skim milk is a valuable food both for man and other mammals. Extensive experiments have been carried on with skim milk in the feeding of the lower animals, and the results of them are found recorded in the bulletins of many of the experiment stations. It is a well known fact that skim milk is extensively used as a human food in almost every farmer's family in the United States. It is wholesome and nutritious, but used alone makes a narrow ration, that is, a ration in which the nitrogen element of the food is largely in excess.

In round numbers, skim milk may be said to contain 3 per cent. protein, 5 per cent. sugar, and 7 per cent. ash, consisting largely of phosphates. To balance a ration in which skim milk forms a large part, bread poor in gluten, may be used, or a bread richer in gluten, together with potatoes and butter. A well balanced meal of a simple and nutritious nature may be made of 500 cubic centimteers of skim milk, 150 grams of potatoes, 100 grams of bread, and 25 grams of butter. This is a ration on which a man could do a lot of work, mental and physical.

DECEITFUL COWS.

Last week several milk producers were brought before a Chicago justice of the peace to answer to the charge of adulterating milk or of selling milk below the standard. Some of them proved to be good, honest farmers with no intent to violate the law, but the evidence was such that the justice decided to fine their cows $5 for giving poor milk, and the owners, as accessories after the fact, were required to pay the fine, says Farmers' Review.

It is indeed a sad state of affairs, remarks the Farmers' Sentinel, when even the mild eyed, innocent cow, friend of man and partner of the hog in the business of mortgage lifting, participates in the general degeneracy of the times and betrays those who have trusted her. If this sort of thing continues, a milk auditor will be required on every dairy farm.

C. W. Leffingwell has a young cow that recently dropped a bull calf. The cow has not, of course, made a record, and Mr. Leffingwell does not know what she will do. The calf is too fine to fatten for veal and yet Mr. Leffingwell does not care to keep it without knowing more about the milking qualities of the dam. The calf is finely sired and would be, doubtless, a good buy for some dairyman desiring a full-blood bull later on.

The dam of this bull calf, has 50 per cent. of the blood of old Pedro, with whose breeding, prepotency and virality all Jersey breeders are familiar. Few animals can be found nowadays with so great a per cent. of Pedro's blood, and the owner of this heifer hopes for great things from her calf as a performer and breeder. She has an immense barrel, and a bigger appetite. Although only a few days in milk, with first calf, she is giving over 16 gallons per day, and increasing at a steady rate, giving promise of bearing a good performer.

Butter is not a simple fat, composed of merely one sort. It is a mixture of no less than seven different sorts of fats, and no more complex oil can be taken than this is.

In curing a heifer of the habit of kicking, the place to begin at is the man.

Save feed now, and waste feed a month hence.

Every atom of heat lost by the dairy cow lying out on the cold ground these November nights must be made up for by increased feed or decreased production.

Have you ever tried to find out how much actual profit old Brindle is making you?

Go slow on corn in feeding dairy cows, but don't cut it out entirely.

Fed on a north wind through the cracks of a barb wire fence. 'Twasn't your heifer that was said of, was it?

KNOWS IT ALL.

No matter how valuable a paper an editor may make, he cannot hope to please everybody. The daily correspondence of the Dairyman office shows up human nature in a highly variegated shape. Here is an example: A man at Auburndale, Wis., writes us that he knows all about dairying now; that there is nothing for him to learn, and he won't have the paper. Is he not just the man to put on the editorial staff. Where else could we find a man who knows all about dairying?—Hoard's Dairyman.

Ranchio Verde people are putting in a new separator and boiler at Victorville.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

EGGS FOR MARKET.

There may be said to be three different branches of poultry business:

First, eggs for market.

Second, poultry for market—broilers, fryers, roasts, capons and old hens.

Third, fancy stock, that is hens bred to win, thoroughbred fowls bred for a purpose, either to be first prize winners for their beautiful shape and plumage, or for laying the greatest number of eggs.

These three branches are exceedingly interesting, but probably the most practical is the "eggs for market," so we will today take up that subject.

* * *

The hen, in her wild state, lays about thirty eggs in a year. The farmers' average hen lays about 100, while on egg farms the average is about 150 eggs, and some breeds or strains will average more. There are 365 days in the year and I do not see why a pullet that is fully matured and comes from an egg-laying strain, that is properly fed and cared for, should not lay over 200 eggs—in fact I have several hens that do even better than this.

I will admit that a hen will not lay 200 eggs a year without constant and intelligent care.

Will the additional number of eggs pay for this constant and intelligent care? That is the question; also, how to give this care and secure the results. I believe in having a high ideal and in attaining the top of the ladder, having the biggest egg yield and the finest birds. It means more work, brings more money and more thorough enjoyment and fun than if I were content to take what comes along—excuse my being personal; I have done it and know what it is. For six years I have been breeding for eggs and now have the 200-egg hen and over. Heredity has as much to do with my hens as handling. Heredity (or pedigree) and handling must go together. The 200-egg hen must be bred to lay. She must come from an egg producing strain, no matter how scientifically a hen is fed, or how well housed. It is impossible to take a flock of mongrels and get 200 eggs a year from them, although good handling will increase the yield, even of mongrels.

What do you call good handling? Intelligent care, just as a mother would care for her children; hens are very much like human beings, have different dispositions and characters, like human beings. The different breeds require different handling, but no matter what breed you have there are three essentials to egg production: comfort, exercise and proper food.

* * *

Under the head of comfort comes first of all cleanliness. A hen that has any lice, or fleas, or mites or ticks on her cannot lay her full amount of eggs. You must help the hen in her efforts to make you money—give her every encouragement to lay. Cleanliness, comfortable, enticing nests, with a mothball in one corner, no lice in them, rather dark, where she may quietly and stealthily deposit her precious egg. If you use trap nests, be sure to have plenty of them so the hens will not be kept waiting. By keeping a hen off the nest she will frequently retain the egg until the following day and learn to be a poor layer. Clean, sweet-smelling roosting place, where she may sleep undisturbed by mites or lice. Just think for a moment how in the human family a fresh, clean bed will court slumber. I have slept, or rather I have spent the night in an Arab house in Africa that was infested with fleas, and I can sympathize with a hen in one of the mite infested henneries I have seen in California.

Comfort, exercise and proper food are the prime factors in successful poultry work. You know, in the human family how greatly exercise is in vogue. Physical culture, gymnastics, Ralston exercises, Swedish movements, fencing, etc., and those who are too feeble to exercise for themselves pay others to rub and pound, or massage them to get the same effect. Exercise is as necessary for the hen as for the human being and more so—for the hen's exercise of scratching develops the egg-producing organs, and makes them lay; if you have a vigorous scratcher amongst your fowls you will find she is a good layer.

In the natural state a hen runs or walks miles, scratches and digs, hunts for worms, bugs, seeds, finds a soft place, lies down and takes a dust bath and rest, then is up again to hunt some more and keeps at it all day—how about a hen in captivity? Kept in a dry, hot, sunbaked yard, foul with droppings, with a little warm, dirty water to drink! What an insult to demand eggs of her!

Exercise she must have to develop the egg producing organs; she absolutely must scratch and dig, if she is to make a living for herself and for you. A scratching pen is for hens in confinement as necessary as food. Mine are 12 feet long, eight feet wide and twelve inches deep, filled with nice clean wheat straw. All the grain is scattered in that and the hens scratch and dig happily all day long, the straw gets broken into small pieces in a very short time, and for every grain she picks up she burys two. Scratching pens can be made any size. I have nailed four boards six feet long together and left a small tree in the middle; this gives shade and keeps the tree mulched. I also spade a place round a tree for the hens' dust bath, and when they are not scratching for a living in the straw they are digging in the fresh earth and bathing in the dust, so keep themselves clean as well as busy. Exercise prevents hens becoming fat and lazy, having small and infertile eggs.

* * *

COMFORT, EXERCISE, PROPER FOOD.

Proper Food.—Here is where intelligence comes in, and here I have learned much by using other people's brains, and as Edgar Warren suggests, let us interrogate nature, and get some of her valuable suggestions—let us take a hen as she comes from foraging in the fields after a long day in summer, kill her and examine her crop—what do we find, grains of wheat, barley, corn, according to where her rambles have led her; bits of grass, clover and vegetables, here a little grain of gravel and a lot of matter partially digested that we cannot recognize. The first thing that impresses itself upon us is that the hen likes variety—the second thing that this variety consists of animal food (bugs, worms and insects), grain and vegetables.

Following nature we must combine these three elements to make a perfect food, or as the scientific poultry books call it, the "balanced ration." Grain, green food, and animal food are the balanced ration. Or, to put it more crudely, the hen is an egg machine (some machines work better than others); put into this clean, well working, active machine the proper condiments and eggs will come shelling out in such quantity that it will surprise you.

The problem is not so much what to feed as how much to feed. Here is where study comes in, where the different breeds have not only to have different food, but especially a different quantity for the best results. It takes a good deal of study to find the happy medium between underfeeding and overfeeding, but I would rather feed too liberally than not enough.

In order to determine how much food is necessary, let us again interrogate nature. Let us weigh the contents of the crop of the hen we killed, a healthy Plymouth Rock, one of the American breeds, coming home at night with her crop full. The crop and contents will weigh about six ounces. From this Edgar Warren deduces that the amount to be fed to a hen should be six ounces a day; or, as he says, a good rule is one ounce for every pound weight of hen in confinement. This is a fair rule, but it entirely depends upon the composition of the food, and also upon the breed of the hen, some breeds requiring more and some less, and for this reason I find it easier and more profitable to handle one breed. It is the same with the different breeds of cows, horses and hogs.

I find with my fowls, White Plymouth Rocks, that I get the best results by varying the food according to the conditions, that is when the hens are moulting they require more protein or feather and bone and muscle forming food, in cold or damp weather more carbo-hydrates or fat and heat energy forming food; in hot weather more vegetable food; so my rations vary with the condition.

(To be continued.)

every ten days. Scaly legs are caused by a small mite which burrows and breeds under the scales. Wash the legs in good hot soap suds and twice a week rub well into them the following: Equal parts of lard, kerosene and sulphur. Paint the perches with lice killer.

For killing mites in hen houses long and full directions were given in the Cultivator of October 16. If you have lost these papers send stamps to the Cultivator office for more.

THE SAN FRANCISCO SHOW.

SAN FRANCISCO, December 1.—This is the opening day of the show and the din of hammers and saws and the running of trucks over the floor comes near drowning out the crowing of the proud birds in the coops. As usual, the first day is get-ready-day.

However, there is already enough in place to form an idea of the wealth of the exhibit. The commercial side is quite prominent. That is, dealers in poultry supplies have good exhibits of their wares.

The most prominent sign is that of the Petaluma Incubator Co. and is across the entire end of the auditorium of the Mechanics' Pavilion. Underneath it are incubators, two pyramids of them, also other incubators with the chicks hatching. Midland Poultry Food fills a large space of the Petaluma exhibit and makes a fine display. Besides, the company have brooders, drinking fountains, bone crushers, "stuffers," lice killers, coops—yes, coops of all kinds, for exhibit, for shipping and for commercial poultry. The International foods and condition powders come in for a fine exhibit by the same company. This exhibit is in charge of H. W. Emerson.

To the right is the Ideal Incubator Co., of San Jose. Mr. Smith and his son are just installing an exhibit of that popular incubator. By tomorrow they promise to have the chicks hatching and at the rate of about one a minute.

The A. R. Coulson Company have a great showing of egg food. Surrounding and above the booth are mammoth car banners, such as the company decorates its cars as it sends out the long distance car load shipments. Samples of the various ingredients, such as meat meal, dried blood, rice meal, millet, oats, etc., are displayed in bottles. Coulson also has lice killers, chick foods, spray pumps, fountains and many other necessaries of the up-to-date poultry raiser. Mr. Sims is in charge until Mr. Coulson arrives, late in the week.

Mr. Bessey, of the Jubilee Incubator Company, has a large exhibit of the Jubilees. The only thousand egg machine agoing is busily hatching its big brood and as proud of it as any motherly old hen over her unlucky thirteen. On top of the monster thousand-egg machine is a baby sixty-egger, doing its duty just the same as the bigger one.

Other exhibits will be installed later and spoken of in a later issue.

But is there no poultry? Sure! Scads of it. Fourteen hundred entries. In pigeons over 300 entries. Dogs and cats are just beginning to come in, but there are some beauties.

One of the judges informed me that the display of poultry is an exceedingly fine one, the best ever assembled on the coast, but unfortunately, owing to the lateness of the moult, the markings could not be as high as if the show had been a few weeks later.

Nearly all breeds are represented, and, as a rule, quite fully represented. One string which attracts much attention is a number of Buff Orpington cocks and cockerels, direct from England.

The Fair Oaks Duck Farm, of Oakland, has ten varieties of ducks—beauties, every one.

The southern part of the state is represented by Los Angeles, Riverside and San Bernardino county exhibits. More particular notice may be given when all the exhibits are installed.

The general managing committee is made up as follows: Chas. R. Harker, San Jose, Cal.; L. N. Cobbledick, Oakland, Cal., Norman J. Stewart, San Jose, Cal., C. G. Hinds, Alameda, Cal., O. J. Albee, Lawrence, Cal., J. C. Williams, Fruitvale, Cal. The latter named gentleman is the secretary.

The judges in the poultry class are: Henry Berrar, San Jose; L. N. Cobbledick, Oakland; C. G. Hinds, Alameda, and S. Tyler, of Pasadena.

The poultry exhibitions of California for this season are as follows:

Mechanics Pavilion, San Francisco, Cal., December 1-5, 1903, under management of the Oakland Poultry Association. J. C. Williams, Secretary, 33 Market St., San Francisco, or Fruitvale.

Los Angeles, Cal., December 8-12. 1903.—Twelfth Annual Exhibition Los Angeles County Poultry Association, to be given in Hazard's Pavilion. Comparison judging. Henry W. Kruckeberg, secretary, 123 S. Los Angeles St., Los Angeles.

San Diego, Cal., January 6, 7, 8 and 9, 1904.—The San Diego Poultry and Pet Stock Association. Harry McIntire, secretary, San Diego.

One of the first things a beginner desires to know is which is the best breed for him to handle. It would appear to him that this ought to be an easy question to answer, and yet it is one that can hardly be answered by even the veteran breeder. It is no nearer a solution now than it was a score of years ago. It probably never will be answered satisfactorily to all breeders. It is very readily seen that the breed that would be best for one person or one locality would be wholly unsuited for another. For this reason the person, the environments, the climate and the market conditions must be factors in determining which is the best breed.

It never pays to keep old hens and young pullets together if it can be avoided. The nearer of an age the flock is the better will be the results obtained.

The pleasure to be derived from pure-bred poultry is incomparably greater than from mixed or mongrel stock. It costs little, is worth much. Have it.

Any of our readers who contemplate buying pure-bred chickens for next year's breeding will do well to make their purchases as quickly now as possible.

S. R. Kellam, Pres. C. T. Paul, Vice-Pres.
Geo. Pomeroy, Treas.

The Poultry and Pet Stock Show of the Season

THE

12th ANNUAL FIXTURE

OF THE

Los Angeles County Poultry Association

TO BE HELD IN

HAZARD'S PAVILION

LOS ANGELES

December 8-12, 1903

It is the purpose of the Los Angeles County Poultry Association corporation to not only make the coming fixture a "good thing" in so far as quantity and quality of exhibits are concerned, but a great gathering of breeders and fanciers calculated to strengthen and stimulate fraternity and develop the poultry industry. In this laudable ambition it expects and asks your cordial support.

The judging will be by comparison with Messrs. Cobbledick, Tyler, Butler and Venn in the saddle.

The awards will consist of honors, many valuable specials and cash premiums.

Admission 25 cents; children 10 cents Send for premium list and entry blanks.

THE APPLE ORCHARD.

(Continued from first page)

Red June.—Twenty-five years ago, a great many apples of this variety were sent to the San Francisco markets, but of late years they have not been so plentiful, and probably the reason may be because they are not so profitable as some other varieties. But for the family orchard they should not be ommitted. The tree is never a robust grower, yet finally makes a good sized tree if properly cared for. Red June apples are not large but rather below medium in size, but they make amends in quality, and appearance. When ripe and fully colored, no apple is more attractive as dessert fruit. Children know good apples and the way they call for Red Junes in one family, proves their popularity.

Gravenstein.—This apple certainly heads the list for quality among all summer apples. Whether profitable or not, as a market apple I do not know, yet I know that a considerable number of trees are being planted in some localities in recent years. But for the family orchard there is no apple that can quite take its place. The first Gravensteins begin to drop about July 4, and for 60 days thereafter, no family with one or two trees of this variety will be without apples for any use that apples may be put. The Gravenstein is a robust grower and a regular bearer if treated right. If allowed to overbear one year, the crop will probably be light the next, but when properly thinned, there will each year be a nice crop of good sized fruit. The Gravenstein is quite uneven in size, that is, the apples on one tree will often vary from two to four and one-half inches in diameter. No matter how large they grow, they are always fine grained and delicious, the small core is one point in favor of the Gravenstein.

Skinner's Seedling.—This is a Santa Clara county production, having originated about forty years ago in this valley. It is not the most desirable market apple, yet it fills a place in the apple market, quite satisfactorily, although the tendency among growers is to pick too green, because when just ripe enough for use, they are quite tender and bruise badly when shipped long distances.

This variety like most others in California, is prone to overbear, and consequently we see in the market many undersized apples, which are not so good in looks or flavor as when grown to normal size which is somewhat above the average. Fruit is green in color, sub-acid, good for sauce, baking, pies, or eating from the hand.

Fall Pippin.—These apples grow in perfection here, and are not surpassed as a family apple, during the month of September, and will keep a month longer, but lose flavor rapidly, unless closely boxed. The apples are large, fine grained, general purpose apples, green in color, sub-acid.

Jonathan.—In season, October and November, without special treatment, Jonathan should always be closely boxed as soon as picked to preserve their delicious juiciness and flavor. The Jonathan is a beautiful apple when properly colored on the tree, in fact I know of no more attractive fresh fruit for the table, and the boys always want Jonathans for their lunch at school.

The tree is not a strong grower and the foliage is delicate and easily injured when spraying, but good crops of medium sized Jonathans may be obtained yearly if well thinned.

Bellflower.—This is one of the varieties so largely grown in the Pajaro Valley, for shipment east and the demand both there and locally seems to be always greater than the supply. It seems that California climate is well adapted to the perfect growth of the Bellflower, for the size, appearance and flavor of the apples grown in California leave nothing to add. They are par excellent.

White Winter Pearmain.—Why this variety should have been designated as White is difficult to understand, for as compared with the yellow Newtown Pippin, one has as much right to be called yellow as the other, and they are both yellow when properly ripened. It is true that both varieties are often picked too green, (for shipment long distances) and then do not attain to the color that proves the mature and ripe apple, but as grown in this state; ripe Pearmains are yellow and often reddish yellow, quite attractive and saleable.

The W. W. Pearmain is not a cooking apple, but an excellent baker, and good to eat from the hand.

Yellow Newtown Pippin.—This is probably the leading apple in California. Possibly two-thirds of all the apples grown in this state are Newtowns, and still the people call for more. It brings the highest price of all apples, both at home and abroad, and contrary to the rule, that a good market apple must be red in color, the Newtown is yellow or greenish yellow, and is not an attractive apple in the fruit stores, except to those who know its quality, and its friends are many, and still increasing in numbers.

From October to May inclusive, eight months in the year, it is possible to have fresh Newtown Pippins, and during those months there is no fruit that can equal it or take its place. If sauce is wanted, or pies, or baked, apples the Newtown is first choice and what apple or any other fruit, is better to eat from the hand during its season, than a well grown, ripe Newtown Pippin?

"When in doubt, plant Newtowns," is good advice to any who contemplate planting an apple orchard.

SUBURBAN IMPROVEMENT.

Now that the fall sessions of the Farmers Institutes are commencing it will be well to incorporate in the programme of the meetings the discussion of some subjects which pertain to the improvement of the general community.

There are some interests which blend in common and which may be discussed, to the advantage of all at each meeting of farmers. Good roads, good schools and rural street improvements are topics which are vital to the prosperity of the country.

Good roads come prominently to the fore in all public thought because so much hangs on their development. Without them we cannot have rural free mail delivery, which has come to be one of the farmers' greatest necessities. In establishing mail routes the condition of the roads is of first moment, and inspectors have the power to turn down, as they do, all routes laid out over badly organized lines of roads. It is simply out of the question to obtain a route where there are impassible fords or boggy, muddy lanes. Added to this is the convenience derived from the use of well made and thoroughly oiled roads.

We believe every family who uses the public roads should be enthusiastic in the matter of their improvement. The women in their clubs should urge the county and township authorities to more diligent action in the making of the roads; the men should be emphatic in their demands that every dollar of road tax shall be expended in making the best roadways that money honestly expended can make.

Land located on well oiled or macadamized roads, with free mail delivery, is worth double what land situated on poorly constructed roads is worth. With good roads the value of the farms would, perhaps, be nearly equal. It is the inconvenience of getting to market and the convenience of good roads which makes the difference in the cost of land similarly situated.

Closely associated with good roads is the centralized school question. Those who have given the subject of centralized rural schools attention, and especially those who have tried the same, are enthusiastic supporters of the proposition.

Under the time honored system of small, isolated neighborhood schools, with few pupils and fewer facilities, where many children in bad weather, must wade through mud ankle deep, or remain at home, and the exposure to rain and cold, costing doctors' bills if nothing worse, in addition to loss of time, is in the end far more expensive than the centralized schools recently adopted in several of the states. Centralized schools require transportation of pupils. Generally they are taken by contract to and from school in covered hacks, properly provided with robes and rugs for cold weather, and the children are put out at the school house at a specified time and delivered at their homes with promptness. In warm countries centralized schools are a great improvement over the old and prevailing method, but bear a direct relation to the public roads. There are many sections of country where for long periods during the school term, the transportation with regularity would be impossible on account of the condition of the roads. Good roads are necessary to good schools under any system, but especially where children must be transported several miles, and from many points of the compass. There can be no consolidated, graded rural schools without good roads whereby these schools may be reached.

Congress is now giving close attention to one or more bills which have for their object national aid to the state good roads fund. If either the Brownlow or Lucy bill shall pass, a revolution in our road system will speedily occur, and the country will derive such benefit as has never been dreamed of by the most enthusiastic advocate of good roads.

"Did you ever know it to fail when a kind word is spoken to your horse, that he will not show, by his eyes, his appreciation of your attention? If you have not noticed this, just try the experiment.

THINK TWICE.

He—"Think twice, love, before you refuse me."

She—"Why should I think twice?"

He—"Because, my dear, a woman never thinks twice the same."—London Judy.

INTELLIGENT FERTILIZING
SUCCEEDING

If you are thinking of using fertilizers you will be interested to know that ninety-eight per cent. of our contracts have so far been renewed. This means that we have rendered good service by intelligent direction in the use of fertilizers, and saved our patrons money as well.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE, CAL.

ROSES.

Editor Cultivator. — Please give, through the Cultivator, a list of fifteen of the best kinds of roses for soil and climate near Glendale. Also, what is the best fertilizer to put in when roses are planted?—A. C. M.

Climatic conditions are not taken into consideration within the country adjacent to Los Angeles, so that the lists heretofore published in this department will generally apply to all of Southern California, both as regards climate and soil. In the case of Glendale, however, if you are in the sandy or gravelly belt you had best restrict your list to teas, for they do much better in light soils than the hybrid perpetuals. The following list will do well in the soil noted: Bride, Bridesmaid, Catherine Mermet, Cornelia Cook, Duchesse de Brabant, Eliza Sauvage, Improved, Rainbow, Madame Joseph Schwartz, Maman Cochet, Marie Van Houtte, Papa Gontier, Perle des Jardins, Safrano, Sunset, White Maman Cochet.

The above named fifteen are teas but to this list should be added two hybrid teas, which will no doubt do well in sandy soil, or you might leave out Sunset and Madam Joseph Schwartz, and substitute Kaiserin Augusta Victoria and Madame Caroline Testout. Both are grand roses. Roses are best planted out while dormant, with bare roots, and no fertilizer should be used until bushes have made sixty days growth. If planted from pot or can, any well-rotted manure will do. As a fertilizer for bushes growing vigorously, cow manure is best.

MILDEW.

Editor Cultivator.—What shall I do for rose bushes affected with wildew, especially the Marie Henriette. How should the latter be pruned, to a single stem?—Subscriber, Claremont.

Mildew is a hard thing to combat, especially on the Reine Marie Henriette. The trouble is largely due to sudden change of temperature, which is aided by injudicious watering. The great difference in temperature between night and day should be equalized as much as possible. The days are hot and dry, therefore water and spray in the morning before the sun's heat becomes very strong, the roses will then have taken in enough water to stand the dry air while this air will be less dry by reason of the soil surface being wet. By watering, in the evening, after a dry day, you give the rose a damp chilly night air, just the reverse of conditions during the day. How can you expect any plant to stand such treatment. Roses as a rule get water too much. When they need it, irrigate them well, very well, and then spray the tops to wash off the dust, etc. A spray with Bordeaux mixture is quite effective for mildew, and so is sulphur dusted on the leaves, allowing some to fall on the ground, if it be dry.

All climbers should be left with several stems, four or six is none too many; why seek to get supplies for a heavy crop through one medium when you may as well use a half dozen?

DECIDUOUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

A CHOICE FIG.

Each year renews our enthusiasm over the Verdal Longue fig. At this time, when all of our best fall figs are becoming watery and insipid, this fig is now at its best. The branches are bending with loads of fine fruit, some of it beginning to drop it is so ripe. While it has not the delicate flavor of earlier figs, it is free from souring and is rich and syrupy. Light showers do not materially damage it, and in locations near to a city and where frosts do not prevail, it should prove a valuable fruit. The color of the skin is bright green, turning to reddish with white showing through the cracks in the stem when ripe.

* * *

PEACHES AND CREAM.

We are now enjoying peaches from Baldwin's Late, and they have the true peach flavor with no bitterness. Peaches and cream are not generally found on most farmers' tables at this season of the year, but there is no reason why they should not. Though this variety is a shy bearer, it pays for the space it occupies and should be in every home orchard.

The station solicits the names of persons who have late or any variety of seedling fruit that gives promise of being valuable. It has a block of trees preserved for grafting promising new seedlings onto, in order that they may be tested for comparison with other varieties.

ABUNDANT RAINS.

Northern and Central California have been visited with copious rains, and the ground which has been soaked in every grain growing district is in prime condition for seeding. The summer fallow which has been dry sown will now spring up and progress with no great amount of needed moisture. The rains of last week were so long in coming and so penetrating that the cereal season is starting fully as well as 1902. If the rains hold out as well as last year, the grain growing section will be as good, if not better than last season, and the state will again witness great prosperity.

IMPORTANT WATER DECISION.

One of the most important decisions in water right matters was taken this week by the Redlands Water company, in which a majority of the stockholders agreed to join the Bear Valley Mutual Water Company and to become a part of said organization. For some time past there has been a conflict of opinion between the members of the Redlands Association, a large number of whom have held that their certificates entitled them to participate in the water of the Bear Valley company, without joining the association. A majority of the Redlands Water company's shareholders however, prefer to join the Bear Valley company, leaving the question at issue in abatement. This decision, says the Citrograph insures the Bear Valley Mutual Water Company to this valley provided that the Cleveland Trust company and the people whom it represents, take a reasonable view of the situation and act accordingly. It removes the only obstacle apparent at the present time to the consummation of this great enterprise, the most important and far-reaching, in its possibilities of good, of all enterprises in our history.

The disposition of $1,000,000 in rebates is alleged by Referee Wean, to have been made to James S. Watson, while president of the Porter Brothers' Company, which failed about two months ago. It is further said no explanation is made in the books of the company why this sum was paid, as it appears to have been.

SOME OTHER DAY.

"There are wonderful things we are
going to do,
Some other day;
And harbors we hope to drift into,
Some other day,
With folded hands, the oars that
trail,
We watch and wait for a favoring
gale
To fill the folds of an idle sail,
Some other day.
"We know we must toil if ever we
win,
Some other day;
But we say to ourselves, there's time
to begin
Some other day;
And so, deferring, we loiter on,
Until at last we find withdrawn
The strength of the hope we leaned
upon,
Some other day.
"And when we are old and our race
is run,
Some other day,
We fret for the things that might
have been done
Some other day;
We trace the path that leads us
where
The beckoning hand of grim despair
Leads us yonder out of the here.
Some other day!"

GRATITUDE OF AN INDIAN.

When Major Henderson of the —th United States cavalry was a second lieutenant serving on what was then always referred to as "the plains" he one day came upon a party of Arapahoe Indians who were about to burn a young Ute at the stake. Indeed the flames were curling about the boy's legs, and he was beginning to feel the agony of burning. Henderson, who had sufficient troopers back of him to warrant interference, dashed in, kicked away the fagots, cut the throngs and set the boy free. Then he took the Indian to camp, where a surgeon dressed his wounds, and after his recovery sent him to his tribe.

When Henderson left the army he gathered a number of Indian implements of various kinds, which he took with him to his home. They were blankets, feathers, moccasins, beads, pipes and a few weapons, such as were used before the red man got the rifle, including bows and arrows. These the major hung about the walls of his smoking room, a profusion of calumets being especially appropriate.

The curiosities were of especial interest to the major"s little boy, Russell, who was never so contented as when his father told him stories about them—stories usually invented by the father, for he knew but few incidents connected with them. Nevertheless the yarns delighted the boy, who had all a boy's love for adventure, and when it was announced on the billboards that a wild west show was coming to town Russell Henderson was wild with expectation. His father promised to take him out to see the procession of cowboys, Indians and "plains" people generally enter the city and afterward to give him an opportunity to see the performance.

When the show made its formal entrance the major was standing on the sidewalk, his little boy holding his hand, the youngster's eyes big as saucers and watching eagerly for the Indians. At their entrance there was an element of surprise which neither father nor son had counted upon. An Indian suddenly threw himself from his horse, made a dash for the major and, extending his hand, said excitedly:

"How?"

Henderson stood looking blankly at the brave, who explained in a few words that he was the Ute whom the major years before had snatched from the burning. The Indian was so demonstrative, so delighted at meeting the man to whom he owed his life, that the major invited him when not engaged in his duties to come to his house. The invitation was accepted and the Ute, who was not in good health, remained after the show had departed. Little Russell was at first very much terrified at him, but when his fright wore off depended upon him for most of his amusement, the Indian telling him more wonderful stories about the decorations of the smoking room than the major had even dreamed.

Russell became much attached to the Indian, and the Indian, who worshipped the major, seemed eager to give the little fellow all possible pleasure not only from gratitude to the father, but affection for the son. Time slipped by, and the Ute, who was suffering from malaria, remained at the home of his benefactor.

One evening Major Henderson came in before dinner and, going into the smoking room, found the Ute bending over Russell, who was standing near a table on which rested an arrow. both the boy and the Indian were looking at the tip of one of Russell's fingers. On it was a red spot about which the flesh was slightly swollen. A terrible anxiety was depicted upon the Ute's features. As the major entered the Indian cast a glance at him, then at the arrow on the table, then back at the major.

"You saved me from a torture death. In return I have brought death to your idol. That arrow was poisoned; the child in handling it has pricked his finger. He will die."

This was what Major Henderson read in the Ute's face. Then suddenly, without a word, the Indian seized the boy's finger and, placing it between his lips, began to suck the wound, pulling so hard that the child cried out.

The poison was drawn from the wound and, entering the thin coating that lined the Ute's mouth, was quickly absorbed. A doctor was summoned and arrived in a few minutes. He administered a drug to the boy, then advanced to do the same to the Indian. His offer was refused. Indeed by this time, though Russell showed no signs of poisoning, the Ute was giving evidence that the deadly weapon of the savage had entered his system.

THE ORANGE SECRET.

It was told me by Maritza, a little Greek girl, in far-away Turkey; and I am going to tell it here and now to every one, because I never have found any American child who had discovered it.

I was finishing my breakfast one morning, when I heard a little sound at my elbow. It was Maritza, who had slipped off her shoes at the outer door, and come so softly through the open hall that I had not heard her.

After I had taken the parcel of sewing her mother had sent, I gave Maritza two oranges which were left in a dish on the table. One of them was big, and the other quite small.

"One orange is for you," I said, "and the other you may carry to Louka. Which one will I give him?"

Maritza waited a long while before answering. At any time she would have thought it very rude for a little child to answer promptly or in a voice loud enough to be easily heard; but this time she waited even longer than good manners required. She looked one orange over and then the ther. After a little more urging from me she whispered, "This one." It was the big one.

Curious to know of the struggle which had made her so long in deciding, I said, "But why don't you give Louka the small orange? He is a small boy."

Maritza dug her little stockinged toes into the carpet and twisted her apron hem before she answered.

"Is not Anna waiting for me at the gate?" she said. "Anna and I will eat my orange together. Mine has twelve pieces, and the other only eleven. Anna would not like to take six pieces if I had only five."

"You can not see through the orange skin, Maritza, to tell how many pieces there are. How is it you know?" I asked.

Then Maritza told me the orange secret, and this is it.

If you look at the stem-end of an orange, you will see that the scar where it pulled away from the stem is like a little wheel, with spokes going out from the center. If you count the spaces between these spokes, you will find that there are just as many of them as there will be sections in the orange when you open it; and so you can tell, as Maritza did, how many "pieces" your orange has.

Perhaps you think every orange has the same number, just as every apple has five cells which hold its seeds; but you will find it is not so. Why not? Well, I do not know. But, perhaps, away back in the history of the orange, when it is a flower, or perhaps when it is only a bud, something may happen which hurts some of the cells or makes some of them outgrow the rest. Then the number of cells is fixed; and, no matter how big and plump and juicy the orange becomes, it has no more sections than it had when it was a little green button, just beginning to be an orange.

The next time you eat an orange try to find out its secret before you open it.—Julia E. Twichell, in Little Folks.

THE COUNTRY FOR HEALTH AND HAPPINESS.

The Cultivator is the friend of the country home, the country boy and the country girl. Often has it said, that health and happiness abound no where so plentifully as in the country. Commenting on this fact, the Saturday Evening Post, a great family newspaper, over two hundred years old, under the title "Back to the Tall Grass," prints the following exceptionally strong editorial, relative to the tendency of city people to drift to the country:

The cities are growing more and more crowded every year as people are attracted to them from the country, and year by year men are learning better the truth, that it is in the country that one can live the sanest life.

Thus we can account for the remarkable exodus of city people to the country, and the tremendous influx of country people to the city.

It is easy to understand why this is so. The city holds out inducements to the country boy that his own environment will never yield him, and he comes to the metropolis, works at his business as few city boys can work, and in course of time he marries a girl who has also come in from the country to earn her liivng, and they settle down in a cozy flat when his means will allow him to do so, and is happy. His children have all the advantages of the city that were denied him when he was a small boy, and if they do not grow up to as lusty a manhood as his, if they do not amount to as much as he did, there are two reasons for it ;they have a rich father and he did not; they were born in the city. Now, it is an undeniable fact that few city men rise high in the council of the nation. If a great man is wise he is born in the country.

Yes, it is easy to understand why there has been such an exodus to the country. The city boy, born and brought up in a brick-walled dwelling, getting a smell of the life-giving country air only during an all too short vacation, envies his country cousin who can breathe ozone all the year round and who has all outdoors for his playground, and he determines to go to the country to live if ever it becomes possible. To be sure he is only a clerk and promotion is likely to stop when he has reached a certain point, but perhaps he can get an ideal little house not too far from the city and lead there an ideal life—and perhaps an ideal girl.

By and by, sons and daughters are born and when the boys reach the state of man they leave the old home and go to the city with the riger of splendid manhood and ideas of country honesty. The end of the matter is the country boy with his strength of character and his vigor of body proceeds in busines to take the best things that are from under the eyes of the city bred children whose country bred father won the prizes of his generation before, and so the city and the country are changing inhabitants all the time and who shall say that it is not for the best?

But he is wisest who, having fled from the city as soon as he was able, keeps his children in the country, there to live and grow. If every one lived in the country, the city would be a very good place in which to live because there would be plenty of room. Pending that time it were better for all city people to live in the country, for there is always lots of room there.

RECIPES

Eat Little, but Have That Little Good

CHEESE PIES.

Two eggs; butter size of a walnut, creamed together; soft, white sugar, to make a medium batter, and grated nutmeg to flavor. Line small patty tins with rich pie crust; put in a scant tablespoon of the mixture, and bake in a moderately hot oven till done. When made just right, the filling should be of the consistancy of good, thick cream, when baked. They are most delicious. Be careful to press smoothly in tins or they will blister. A little experience will be all that is needed in making these pies.

FINE COOKIES.

Two cups of sugar; one cup shortening—butter preferred; three eggs; two cups seeded or seedless raisins, one teaspoon cinnamon; one teaspoon cloves; one-half nutmeg (grated); three tablespoons sweet milk; if cookies are desired very rich, the quantity may be doubled, and cookies still be excellent. Dissolve one teaspoon soda in the milk, and use flour to make a dough that will be soft, but not sticky.

GINGERBREAD EXCELLENT.

One cup sugar; one cup molasses; one teaspoon ginger; one teaspoon cinnamon; beat well; five cups sifted flour; one cup sour milk; mix well; beat four eggs light and stir in; dissolve two teaspoons soda in a little hot water, and add last. If spring wheat flour is used, scant measure a little.

HEALTHFUL DIET.

Professor Kiosoto, an eminent Japanese bacteriologist, also Professor Koch and others have shown that the acids of lemons, apples and other fruits, citric acid and malic acid, are capable of destroying all kinds of disease germs. Cholera germs are killed in fifteen minutes by lemon juice or apple juice, and typhoid fever germs are killed in half an hour by these acids, even when considerably diluted.

If you squeeze a lemon in a glass of water containing cholera germs, and let it stand fifteen or twenty minutes, you may drink the water with impunity, as the germs will be dead. These juices will kill other disease germs, Instead of telling a man to have his stomach washed out, we can now tell him to drink fruit juice, which will cleanse the stomach as well as a stomach-tube, provided it is not a case of gastric catarrh.

In ordinary cases of biliousness, foul tongue, bad breath, sich headache and nervous headache, a fruit diet is a wonderful purifier. The fruit diet will cleanse the stomach and the alimentary canal and drive off disease germs, which are responsible for a large share of our ailments.

THE WOMAN AND HER HAT.

No woman who has held in her lap a hat during an entire performance at a theater will fail to appreciate the little contrivances that are being introduced in the New York theaters for the holding of hats. Small V-shaped pieces of metal, with a hole in them through which a hat pin will pass, are fastened to the backs of the seats, coming directly in front of occupants of the seats back. They are calculated for hanging hats on. By passing a hat pin through some convenient part of milady's headgear, and then continuing the hat pin through the metal arrangement, the hat is comfortably and safely disposed of for the evening, except when the man in the next seat squeezes himself past when going out between acts. At such times it behooves the owner of the hat to grab it from its moorings before the man reaches it.

There is nothing more repulsive to the senses than a snappish, cross, young girl—unless it be a vulgar, outlandish boy. Young girls should be full of sunshine if they expext to be admired. Boys should be manly and polite if they would be liked.

HELPFUL HINTS.

Simplify the work, first, by bringing each family member into a rightful share therein. The family where the children "help" is the exception rather than the rule. Boys and girls can make their own beds and keep their rooms in order; can be taught to put their own things away, and taught to work in a way that will make it delightful. Most children want to do what mother or father does, but are put aside until, when they are old enough to help they do not wish to. Always encourage every effort at helpfulness.

A cream separator saves a great deal in handling milk. Some think washing machines are work savers, while others who cannot run a machine can wash by the old way. It saves work to fold the clothes from the line. Many pieces if thus folded will be almost as smooth as though ironed. Some do not even iron every-day dresses and apron. I think starching and ironing keeps them clean much longer, but there is a difference of opinion.

When baking bread, utilize the top o fthe stove for other things. In kneading bread, if the dough is chopped occasionally with a chopping knife it facilitates the process to a great extent. Linoleum on a kitchen floor is a great work saver, but paint is not to be despised. The work is lessened half in cleaning a floor by even having it even well painted. Enamel the sides of the cook stove occasionally and wash the top or rub clean with paper. This saves the daily blacking. I have seen woodwork painted dark red and varnished, and it saves a great deal of labor in cleaning, besides it always looks nice. Kitchen chairs treated the same way can be simply wiped off and the weekly scrubbing be done away with.

If flies get into the parlor, don't worry but set a dish of poison fly paper in there and shut the door. It is much easier than driving them out, and you will not get gray fretting.

Short skirts for wearing to do housework save a good deal of washing, and if made of dark material, will also be labor savers in that way. Shirt waists or tea jackets are easily done and with a dark shirt one can be fresh and neat all the time nearly. Painted floors for bedrooms are clean and easily taken care of. Saves heavy sweeping, and also the sewing of carpet rags, or lifting heavy carpet at cleaning time. White bedspreads are labor savers, as they are much easier washed than bed quilts. Some turn a white spread back down in day time. This is false economy in work and expense as well. A cheap bed spread costs about as little as anything, and is easy to wash. Hence I advocate the white cover for every bed in the house.

Put away all the useless frippery in the rooms. They will look neater and be much less work to dust and care for. A cabinet for shells, curios, etc., is a great work saver, as the things can be kept in it and not need moving every time the room is cleansed. Time can be saved by avoiding trashy reading and devoting it to that better. Nothing helps the work along like a serene mind, and the Bible is a great panacea for all unrest. Lillian Whiting's first and second volumes of "The World of Beautiful" simplify and enlarge life greatly. The third volume I cannot recommend wholly. Kerosene saves work in washing windows, mirrors, etc. It is a great cleanser. Iron bedsteads are clean and easily cared for, while mattresses save much work over the oldtime feather bed and husk tick. These latter produce a great deal of dust and fluff, System is a good thing, but a cast iron rule breaks many things if not itself broken. Taking thought in all things saves countless steps. Hardly one woman in ten knows how or uses the appliances on her sewing machine. Learn how; this saves time. Bags for bundles save time. Keep those pieces like things in wear in a handy bag, and you will not have to spend fifteen minutes hunting up a patch. Kitchen cabinets are work simplifiers.—R. S. M., in Indiana Farmer.

Los Angeles Markets.

Los Angeles, Dec. 3, 1903.

The holiday past, poultry now comes into market in ample quantities from first hands.

Butter and eggs continue firm and ranch eggs are scarce. No decline in price is anticipated for some time to come.

Highland potatoes are now laid down at $1.10 per hundred, although the trade realizes $1.15@1.25. All grades of potatoes are firm.

Cranberries are coming in very freely and sell at $10.50@11.50 according to quality, per bushel, in unbarreled lots.

No special change marked the bean quotations for the week.

Sugar has declined 20 cents a hundred on all grades.

Oysters will shortly be received in new packed lots as advices from New York say a large quantity has been shipped to coast points. The pack is firm.

San Francisco Markets.

Dairy.

SAN FRANCISCO, Dec. 2, 1903.

The demand for medium and under grade butter has been sluggish this week and the market has been in an unsatisfactory condition, despite the inducements offered by sellers. As compared with last week the market shows a decline.

BUTTER—Per lb:

Creamery, extras	30	
Creamry, good to fancy	25	@29
Dairy extras	23	@24
Dairy choice	21	@22
Store	18	@20
California storage	24	@27
Eastern Creamery	23	@25

Cheese remains the same as last week.

Eggs and Poultry.

Prices for Ranch Eggs eased off slightly under a less brisk demand and larger offerings. Supplies were well cared for at the revised figures and the market ruled steady, with the best grades of Ranch easily bringing the outside price. Storage Eggs were in good demand, and the ruling rates were firmly held.

EGGS—Per doz:

Ranch, selected large	52½	@53
Ranch, good to choice	45	@50
Store	Nominal	
California storage	28	@32½
Eastern	25	@30

Late offerings of poultry are all cleaned up. Turkeys are offered in fair lots and bring good prices at active sale.

Fruits and Vegetables.

Good quality of fruits brought firm prices this week. Apples lead in demand, and the better qualities find ready sale. The following are the quotations:

California Apples—Extra, $1.45@1.65.
Pomegranates—Per box, $1.50@2.00.
Persimmons—Per box, 65c@$1.00.
Quinces—Per box, 60c@$1.00.
Table Grapes—Per small box, 40@65c; crate, 65@90c; large box, nominal.

BERRIES—Per chest; Strawberries, Longworth, $12; large varieties, —, as to quality; Raspberries, $6; Cranberries, per bbl, Eastern, $11@12; Oregon, per box, $2.50@$3.50.

CITRUS FRUITS—Per box: Oranges, new crop Navels, $2.75@$3.25; Seedlings, $1.75@$2; Late Valencias, $3.50@$5; Lemons, $1@$3; extra, $3.50; Grape Fruit, $1.50@$3; Tangerines, per box, $1.25@$1.50; Limes, $4@$5.

All the better varieties of vegetables found a ready market in the buyers for local and country trade.

CITRUS FRUITS—Per box: Oranges, new crop Navels, $2@3; Seedlings, $1.50@2; Late Valencias, nominal; Lemons, $1@2.50; extra, $3; Grape Fruit, $1.50@3.50; Tangerines, $1@1.75; Japanese Mandarins, $1.50@1.75; Limes, $4@4.50.

No important features are noted in the vegetable market, prices continue steady as quoted. Arrivals from the South have been light this week and the offerings inferior in quality.

The quoted rates for Peas, Beans and Summer Squash were for the best, while larger lines of off stock were disposed of below the minimum figure, and much were entirely ignored. Tomatoes were very weak, and prices strongly favored the buying interests.

VEGETABLES—Tomatoes, per box, 50c@$1: do, southern, per crate, 50@85c; Green Peppers, box, 40@75c; String Beans, per lb, 4@6c; Wax, 4@6c; Los Angeles Green Peas, per lb, 2@4c; Egg Plant, per box, 50@75c; southern Summer Squash, per box, 50@65c; Cucumbers, per box, 75c@$1; Mushrooms, per lb., 12½@25c; Garlic, per lb., 6@8c; Dry Okra, per lb., 12½c; Marrowfat Squash, per ton, $10@15; Hubbard, $12.50@20.

ONIONS—Yellow, per ctl., 90@$1.25.

Dried Fruits, Nuts, Etc.

Spot trading in all lines of Dried Fruits is very slow and confined principally to small jobbing wants from local consuming channels.

DRIED FRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 4½@6c; Sun Dried, 3¼@4c.

Apricots—Royal, fancy, 9@10c, choice, 7½c @8½c; Moorparks, choice, 9½@12c.

Peaches—Choice, 5¼@6c; fancy, 6½@7c; peeled, in bxs, 11@14c.
Pears—Choice, 7½@8½c; fancy, 9c.
Plums—Pitted, 6¾9c; unpitted, 1@1½c.
Prunes—Four sizes, 60s to 100s, 2¾@3c for Santa Clara; other sections, ¼@½c less.
Nectarines—White, 4@5½c.
RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1903 crop, f. o. b. at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.35; Two-Crown London Layers, $1.25; Muscatels, Four-Crown Standard, loose, 6½c per lb; do, Three-Crown, 5⅝c; do, Two-Crown, 5¼c; Seedless Muscatels, 4¼c; Seedless Muscatels, floated, 4½c; Seedless Standard Sultanas, 4¼c; Thompson Seedless, Standard Sultanas, lencias, Standards, 4¼c; do, Pacifics, 3¾c; Orientals, 2¾c; Malagas, Three-Crown, 5⅝c; do, Two-Crown, 5c.
Seeded Raisins—Prices for limited quantities are as follows: Fancy, 16 oz, per lb, 8c; choice, 7⅝c; fancy, 12 oz, per pkg, 6⅝c.
NUTS—Per lb: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Peanuts, Eastern, 6@6½c; California, Walnuts, soft shells, No. 1, 13@14c; do, No. 2, 11@12c; hard shell, No. 1, 12@13c; do, No. 2, 10@11c.
HONEY—New Comb, per lb, White, 12@14c; Amber, 10@12c; Extracted Water White, 5½c@6c; Light Amber, 5@5½c; Dark Amber, 4½@5c.

Beans.

Market fluctuations, generally in the line of improved values, were noted in prices for most descriptions of Beans this week and operators reported a moderately active market at the revised figures.
BEANS—Prices per ctl: Large White, $2.35@2.65; small, do, $2.90@3.10; Pea, $3@3.10; Lima, $3; Red, $3@3.15; Pink, $2.40@2.65; Bayo, $2.15@2.25; Blackeyes, $2@2.25; Red Kidneys, $4.25@4.50.
DRIED PEAS—Green, $2.50; Niles, $2.75.

Live Stock.

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 6½@7c; No. 1 Cows and Heifers, 6½c; second quality, 5½@6c; thin Cows and Heifers, 4@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.
CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.
SHEEP—Per lb: Fat Wethers, No. 1, 3½c @4c, gross weight; Ewes, No. 1, 3¼@3¾c; gross weight.
LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb, live weight.
HOGS—Per lb: Hard grain fed, weighing alive 130 lbs and over, 5⅝@5½c; weighing under 130 lbs, 5@5¼c; weighing 260 to 350 lbs, 5@5¼c; rough heavy, 4@4½c.

FRESH MEAT.

BEEF—Per lb: No. 1 Steers, 7@7¼c; do, second quality, 6½@6¾c; No. 1 heavy, 7@7¼c; thin, 5@5½c; No. 1 Cows and Heifers, 5½@6c; second quality, 5½@6c; thin, 3½@4½c
VEAL—Per lb: Heavy, 7@7½c; medium, 7½@8c; light, 8½@9½c; poor Calves, 6@7c.
MUTTON—Per lb: Light Wethers, 8@8½c; do, Ewes, 7½@8c; heavy Wethers, 7½@8c; Ewes, 6½@7c.
SPRING LAMBS—Per lb, 8½@9½c.
DRESSED HOGS—Per lb, 8@8½c.

Hay and Feed Stuffs.

HAY—Prices on Hay, per ton: Wheat, $13.50@17; Wheat and Oat, $13@16; Oat, $11.50 @$14.50; Barley, $10@13; Clover, $9.50@11.50; Alfalfa, $$9.50@12; Stock, $8.50@10.50.
STRAW—Good to choice, per bale, 55@65c.
FEED CORN MEAL—Choice grades, per ton, $30@31.

WHEAT—No. 1 shipping, per ctl., $1.38½@1.40½; White Milling, good to choice, $1.38¾ @1.50.
BARLEY—Choice No. 1 Feed, $1.10@1.13¾; off grades, $1.07½@1.08¾; Brewing, No. 1, $1.16¼@1.21¼; Chevalier, $1.30@1.45.
RYE—Good to choice, per ctl., $1.25@1.30.
CORN—Good to choice, per ctl: California, new, large Yellow, $1.22½@1.30; small, do, nominal; White, $1.25@1.30.
CRACKED CORN—Choice quality, per ton, $30@31.
OATS—Good to choice White, $1.25¾@1.35;

Hops.

The price for new crop is 19@22c per lb, according to quality.

WOOL.

Fall clip, per lb: California Plains, 6@8c; Foothills, 8@10c; Middle Country, 10c@12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

CHICAGO, Dec. 2.

The wheat market assumed a firmer status today, owing to the liberal purchase by leading long. Toward the close of the day a reaction took place which caused a decline of May Wheat to 80¼c.

Cash quotations were as follows: Flour was quiet, but firm; No. 2 spring wheat, 80@84; No. 3, 75@81; No. 2 red, 84@85⅞; No. 2 corn, 42½; No. 2 yellow, 44½; No. 2 oats, 35½; No. 3 white 35@38; No. 2 rye, 51; good feeding barley, 34@35; fair to choice malting, 41@54; No. 1 flaxseed, 91; No. 1 northwestern, 97½; prime timothy seed, 2.80; mess pork, per bbl., 11.12½@11.25; lard, per 100 lbs., 6.50@6.52½; short ribs, sides (loose,) 6.25@6.62½; short clear sides, (boxed,) 6.12½@6.25; clover, contract grade, 11.00.

Grain Movements.

Articles	Receipts.	Shipments.
Flour, barrels	58,200	19,500
Wheat, bushels	212,600	169,100
Corn, bushels	208,200	115,300
Oats, bushels	357,400	248,200
Rye, bushels	9,100	3,000
Barley, bushels	205,200	20,000

CHICAGO, Dec. 2—Cattle—Receipts, 2500; slow; good to prime steers, 5.25@5.75; poor to medium, 3.50@4.90; stockers and feeders, 2.00@4.10; cows, 1.50@4.00; heifers, 2.00@4.75; canners, 1.50@2.40; bulls, 2.00@4.30; calves, 2.50@6.50; Texas fed steers, 3.00@4.00; western steers, 3.00@4.50. DAIRY MARKET.

On the Produce Exchange today the butter market was firm; creamery, 16@25; dairy, 14@21; eggs, easy, 23@25; cheese, steady, 10@10½.

California Dried Fruits.

NEW YORK, Dec. 2.—The market for evaporated apples is still quiet, with the tendency in buyers' favor; common, 4@5; prime, 5¼@5½; choice, 5¾@6½; fancy, 7. Prunes remain quiet, at 2½@6½ for all grades. Apricots are in fair demand, but present no feature of moment, ruling steady; choice, 9@9½; extra choice, 9¾@10½; fancy, 11@1… Peaches continue dull; choice, 7¼@7¼; extra choice, 7⅝@⅛; fancy 9½@10¼.

CITRUS MARKETS

THE ORANGE MARKET.

The markets in general are opening up with rather low prices, and considerable hesitancy on the part of the trade in purchasing stock. The auctions and general Eastern markets are selling Floridas at about $2.00 per box delivered, with plentiful supplies at this price.

The first cars of Californias, large size Fancy Navels, rather poor color, have sold in the auctions at about $2.35.

Western markets are not disposed to buy freely of arrivals at the present time, preferring to wait until a little nearer Christmas.

The situation on the whole is not particularly bright, and every indication points to lower prices for holiday oranges than California has ever had.

Floridas are reported to be showing considerable decay, which would indicate the necessity of their cleaning up the crop earlier than last year.

Shipments from the southern section of the state are rather light this week, but must be heavy next week, as cars shipped later than the 12th will not arrive in markets in time for the Christmas trade. Shipments from Northern California will be practically finished by the 10th. Some sections finishing this week. Sizes have been very large from this section, and lists of southern shipments show a very heavy proportion running to the smaller sizes.

There is a very light demand, especially for the off small sizes, in the holiday trade, and these should be left on the trees and allowed to grow larger.

THE LEMON MARKET.

LEMON MARKET: The prices on foreign lemons sold in New York during the past week have shown a heavy decline, which is also the case with a few cars of Californias sold in the same market. Western markets, especially some of the central sections that can buy either foreign or Californias, are feeling the decline in auction markets, and prices are easier in consequence, to the extent of some 50 to 75 cents per box.

There is no demand for standard fruit.

Total shipments to date this season, 280 cars, of which 179 cars are lemons. Total to same date last season, 348 cars, of which 217 were lemons.

The highest price paid for a carload of lemons was paid this week for a car of Azusa lemons, which were of the finest quality, bright, juicy and silky in appearance. The car netted over $1500.

AUCTIONS.

New York, Nov. 24.

Semi-Tropic Fruit Ex., XXX lemons, $3.50. E. E. E. lemons, $2.80.

Cleveland, Nov. 24.

Q C. Fruit Ex., Corona Beauty lemons, $2.70. Grove, $2.10.

New York, Dec. 1,

C. C. U., Exeter, Mariposa navels, $2.30.

Possibly that bull of yours would be just as serviceable with his horns off and a ring in his nose. He'd be a great deal more tractable, at any rate.

We have a friend who set a hen on ten eggs and she hatched out six. Of these, two died. At the same time he set the hen he put twenty eggs in the incubator and hatched out nineteen, every one of which lived. Now he will not have a hen set. Says it does not pay.

ONIONS FOR NAMES

I have mixed a lot of onions; one kind is early, white and flat, now matured. Can you name them and are they the earliest onion to mature?
"B." Lamanda.

Your onion seems to be the Queen, and if so, is the earliest of all.

SUMMONS.

No. 42415. Dept. No. 5.

In the Superior Court of the State of California, in and for the county of Los Angeles.
Chas. B. Estill, plaintiff, vs. Mollie Estill, defendant.
Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the clerk of said Superior Court.
The People of the State of California send greeting to:
Mollie Estill, defendant.
You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.
And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for any other relief demanded in the complaint.
Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 19th day of Sept., A. D. 1903.
(Seal) C. G. KEYES, Clerk.
By C. O. Winters, Deputy Clerk.

EGGS

Now is the season of the year that eggs are worth having to sell and the more we have to sell the better we like it; therefore, if we are in the poultry business, we want to feed the hens the kind of feed that will make them lay. It is worth something to know just what is good to make hens lay, but there is such a feed and one can buy it already mixed to feed, and it doesn't cost any more than any other feed in the end, because it is richer and goes farther. The Balanced Ration Egg Food, prepared by the A. R. Coulson Company of Petaluma, is what the Petaluma poultrymen use to make their hens lay. Not only Petaluma poultrymen, but poultry raisers all over the state of California are beginning to find that it is more profitable to feed Coulson's Balanced Ration Egg Food than any other kind of feed.

A. R. Coulson, the chicken doctor of Petaluma, has made a special study of the feeding problem and he has got it down to a science, and so successful has been the use of this food that $25,000 was invested by the company to manufacture this feed and sell it as cheap as possible. All the ingredients are purchased in carload and even shipload lots, as steamers and schooners come daily to Petaluma loaded with

grain and feed. By purchasing everything in immense quantities they are able to use the best of everything needed in the feed and still be able to sell it to the poultrymen at reasonable prices. The granulated or fine ground dried beef blood is prepared at the largest packing houses in the world, at Kansas City, and shipped to the A. R. Coulson Company, in 25 and 30 ton lots (the value of a big carload of this article is nearly $2000.) Fine ground beef meal and beef scraps are also shipped from the packing houses at Omaha and Chicago.

There are about twenty different articles used in preparing Coulson's Egg Food and they are all purchased in large quantities and mixed in a large electric mixing machine (the only one like it on the Pacific Coast), and from 250 to 300 sacks a day are turned out at this factory.

It is a good thing for the poultrymen to get this feed already mixed in this way, for you only have one profit to pay, where if the poultryman was to purchase each article separately he would have to pay a profit on each article used, and the more expensive articles he could not afford to use, as on small quantities of some articles would cost the poultryman if he purchased it a few pounds at a time, 10c or 12c a pound, so that he could not afford to use it; but where it is purchased in 30,000 or 40,000 pounds at a time the same article can be had for 2 or 3 cents a pound; therefore it is much cheaper to buy Coulson's Egg Food already mixed and save time, labor and expense. Besides, when you get Coulson's Egg Food you can rest assured that it is prepared just right and contains everything in the right proportions, and is more thoroughly mixed, being mixed in a machine that mixes every portion together so thoroughly that every part is just alike, after it comes out of the machine. If you want to get eggs you must feed that which makes eggs. A hen is simply a machine; feed her properly and feed enough of the right kind of feed and you are bound to get eggs.

In order to get eggs out of a hen we must put eggs into a hen, or in other words, we must feed right, and Coulson's Egg Food is just the feed that Biddy needs to help her make the eggs.

You can get Coulson's Egg Food at most any feed store, or, if not, you can send to factory at Petaluma and have it shipped by freight.

The State Fruit Growers' Convention

Fresno, Dec. 8.—From Shasta to Orange county fruit growers have come to join in the work of the State convention. There are some new faces, but the attendants are much the same as in the past and are, as usual, largely from outside the city in which the convention is held.

The large hall in only partially filled but the interest has been most marked. Decorations of potted plants and flowers are profusely made, also a bank of oranges—Fresno grown—are arranged in front of the speaker' stand. It is nice looking fruit, as is a display of persimmons.

About the room are arranged tables with exhibits of dried fruits by Fresno Home Packing Co.; apples, also large finely colored strawberries, from Watsonville, and a display of figs, olive oil and nursery trees by Geo. C. Roeding, of the Francher Creek Nursery, Some of these figs are of last year's pack and, after this severe test, are delicious and attracting much attention.

President Cooper, State Commissioner of Horticulture, called the convention to order soon after ten o'clock and Rev. Thomas Boyd of Fresno offered an eloquent prayer.

Mayor L. O. Stephens extended welcome, turned over the keys to the city and hoped for the association a valuable session—as he knew it would be valuable to the growers about Fresno. Fresno has much to show to visiting fruit growers in its irrigating systems of a magnitude seldom equaled, in its vast extent of vineyard, in its schools, its Chamber of Commerce and its great prosperity.

The first act of the association was the election of vice presidents, H. P. Stabler, A. M. Drew and W. R. McIntosh being named.

John Isaac, secretary to the state horticultural commissioner, was named as secretary.

President Cooper's annual address reviewed the condition of the fruit industry of the past year, also reviewed the work of the commission. The results accomplished in the control of injurious insects was commended but the spread of fungoid diseases presents most discouraging phases. Especial reference was made to walnut blight, pear blight, vine diseases, etc. The most hopeful feature of the year has been the large yield and good prices of decidious fruits. The present fight and boycott of the commission men and retailers of San Francisco on organized fruit growers was referred to at some length. This combine has made a bitter fight against free market and the selling of products of the soil in San Francisco, save through the combination. The state harbor commissioners and the press and people of the city here united to oust the combine. The pure food law was referred to and its more rigid enforcement was demanded.

This report was referred to John Markley, Geyserville, Geo. L. Hunt, Sacramento; Edward Berwick, Pacific Grove; A. N. Judd, Watersonville and W. R. McIntosh of Fresno as a committee on the message.

Hon. John Tuohy of Tulare spoke on the farmer as a taxpayer, and made a strong showing of the injustice to which the owner of real estate and especially the farmer has to submit to, in carrying by far the greatest proportion of the burden of government support. Not only is the farm held for nearly its full value, but the most minute report of all stock and appliances is demanded. From an assessor's list sheet he read to show that the merchant is assessed for a certain amount of merchandise and fixtures; a saloon keeper for saloon and fixtures, etc; while the farmer must certify to number of wagons, number of buggies, number of harnesses, cultivators, plows, mowers, colts one year old, colts two years old, colts three years old, American horses, mules, etc—going into most minute detail of every feature on the farm.

How to accomplish a reform, Mr. Tuohy had no remedy to offer, but recommended the appointment of a committee to investigate and report at some later session.

The committee afterwards appointed consists of Hon. John Tuohy, John S. Dore, Hon. A. M. Drew, S. P. Saunders and Frank E. Kellogg.

Chairman Cooper afterwards appointed a committee on resolutions as follows: John Markley, Mrs. Dr. Sherman, Mrs. B. F. Walton, Prof. A. J. Cook, and Frank E. Kellogg.

"What the Post Office should do for the Fruit Growers" was the first address of the afternoon. It was by Edward Berwick of Pacific Grove. Mr. Berwick is president of the California Postal League. He spoke of the membership of the league and the necessity of supporting it with means and with interest. Mr. Berwick made comparison of this country with Germany, England and other nations in the matter of postal systems and the comparison was certainly in favor of the foreign countries.

The Pope bill now before congress calls for delivery of parcels, anywhere in this country, of one pound of merchandise for three cents, and eleven pounds for 25 cents.

A resolution of thanks was tendered Mr. Berwick for his labors in behalf of postal reform.

A committee on transportation appointed at the San Francisco convention last year consisting of Rus D. Stephens, chairman, Alden Anderson, A. H. Naftzger, A. N. Judd, Alex. Gordon, reported; though the report was signed only by the first named and the last two. The report dealt at length with abuses of transportation especially in the excessive charges of refrigeration and in long time of transit for perishable fruits. Chairman Stephens appealed for pressure to be brought to bear upon the railroads that a contract should not be made with car lines at the expiration of the present contract two years hence. The enormous profits of this combination has been partially shown in the Porter Brothers investigation now being held wherein one man secured rebates exceeding a million and a half. The resolution was adopted.

Mr. Sprague for the committee on local association reported as follows:

"Efforts have been made to secure such organizations at several points most interested in securing fair market conditions there, but up to the present time none have been found with enough local initiative to secure such organizations except upon the Sacramento river. This association has successfully conducted the large business of the Growers' Co-operative Agency during the past season in San Francisco and urgently invites every locality interested in that market to form a local association to become a branch of the Growers' Co-operative Agency, thus joining them in the conduct of its affairs.

Your committee is convinced that abuses of no kind can be very effectively remedied without the concerted action of those who suffer from these abuses, and such concerted action is best secured by local organization of growers. They therefore recommend the continuance of the effort to secure such organization."

The first paper of the evening was written by Hon. Alden Anderson, Lieut. Governor of the state, and in his absence was read by the secretary, John Isaac. It was a report of operations of the Distributors, and showed a summary as follows: The fruit was distributed in 131 cities which had California fruits in carload lots. Grapes were shipped in much larger quantity than ever before. The total shipments were as follows: Cherries, 211 cars; apricots, 231 cars; peaches, 1867 cars; plums and prunes, 1145 cars; pears, 1719 cars; apples, 670 cars; figs, quinces, nectarines, etc., 23 cars; grapes, 1802 cars.

The prices on the whole were satisfactory.

M. Theo. Kearney, of Fresno, read a paper on co-operation in marketing cured fruits, from which we quote in part:

"We are holding our meeting in the town and county of Fresno. Fresno has been my home and the field of my labor for thirty years, and it would be most agreeable to me simply to express the great pleasure which I, in common with all the people of this central portion of the state, have in welcoming to our midst our brother fruit growers of California, and in thanking you most cordially for the great honor yau have done us in again selecting our town for the holding of your convention.

* * *

We fruit growers of California have been accustomed for so many years to be praised for our thoroughness in the cultivation and general management of our orchards and vineyards, for the intelligence and skill displayed in the selection of varieties of fruits, and the combatting of insect pests, for the broad-minded and masterful enterprise shown in the rapid development of our industry, and for the great success achieved in the quality of our products, that perhaps we may be in a measure pardoned for sitting still and purring gently while our fur is being stroked the right way.

We have had weak and half-hearted efforts to organize the producers of cured peaches, apricots and pears, but with no success.

As to the efforts to organize the prune growers you all know about that miserable failure. And yet while the prune growers are this season making a desperate effort in a detached way to force up the price of prunes to a 3c or 3¼c basis, every man familiar with market conditions, and the absolute fruit famine this year all over the world, knows that if the growers were united in a marketing organization they could get 4c easier than they are getting 2½c now. In France the prune growers are getting three times the price the California growers are getting, and for no better fruit, in fact, not as good as ours. In Hungary, some weeks ago, some of the prune growers not knowing the situation, sold at a low figure; others found out about the scarcity and at once raised the price 100 per cent, while those who sold early almost created a riot because the government officials were slow in issuing their crop bulletins. Pray God that we may develop some of that spirit here in California.

As to the methods of organization, resourceful men should be able to devise half a dozen different methods,

OF GENERAL INTEREST.

The Poultry Show.—The Los Angeles Poultry Association is holding one of the most successful exhibits held in this state. The number of entries will be about double those of last year, which was regarded as a fine show. The interest manifested in poultry, and especially in fine breeds, is far in excess of any former year. There are many more birds of expensive pedigree, and a great many more people looking up varieties than ever known in the history of poultry culture. It goes without saying that the fowl is king in California.

* * *

Herbert Spencer.—The passing of Herbert Spencer to spirit life marks the event of the year in litirary prominence. He was indeed one of the world's greatest thinkers and writers in that he was able to bring together the sum of human knowledge and treat the universe from one view point. He was so broad in his comprehension of life and its philosophy, that he was able to work along various lines instead of being confined to a single branch of science. As a writer on synthetic philosophy he stood pre-eminently the most distinguished of the century.

* * *

The residents in the Cahuenga orchard district, in which Hollywood is situated, who were frightened because of the mischievous reports circulated that the West Los Angeles Water Co. is about to deprive that district of water, for domestic and irrigating purposes, will be glad to know that no such an act was ever thought of by the managers of that enterprise.

Rain Needed.—The need of rain is beginning to be noticed by our agriculturists. This, so far, has been an exceptionally dry season, one rain having fallen during the past two months, up to the time this is written (the last day of November.) Last year two inches of rain fell in November, and the average for the month for thirty years is one and a half inches. Rain is needed to wash the gutters, and the sewers, and the trees, and the atmosphere, and to freshen things up generally.

* * *

For Good Roads.—The Cultivator is glad to note the interest being taken in the matter of improving our roadways. In this, and other counties, in this part of the state, an active campaign is now being made and a memorial is an urgent request of Congress signed by the dairymen, the citrus fruit people, the automobilists, the farmers and everyone interested in good roads. The burden of the memorial is an urgent request of Congress to pass the Brownlow bill, or some similar measure. This bill provides for an appropriation of $20,000,000 by the government to be apportioned among states and similar political subdivisions according to population, for the improvement of roads. California will receive $500,000 as her share. but the bill provides that each locality shall furnish an amount equal to that to which it is entitled.

* * *

Report of Secretary of Agriculture.—The annual report of the Secretary of Agriculture for 1903 is at hand. It is a voluminous document of over 100 pages and deals with the varied agricultural conditions of the country in the terse and interesting character of the author. He takes up the qustion of enforcing the pure food law and the inspection of animals and animal products, and recommends the most careful and vigorous enforcement of all laws covering these interests. In the Department of Animal Industry a satisfactory showing is made. Blackleg has been greatly reduced in percent, and hog cholora very materially curtailed in its ravages.

* * *

The State Fruit Growers:—The convention of fruit growers now in session at Fresno is the twenty-ninth held under the auspices of the State Board of Horticulture, or more properly now the State Commissioners of Horticulture. Some years since they were held semi-annually, then owing to shortage of funds were held annually, usually in the north. At the San Francisco meeting last December it was announced that funds would permit the holding of two sessions, so a spring meeting was held in Los Angeles. If these meetings benefitted only those attending, it would be a discouraging waste of state money. But very few hundred, at most, are ever attracted by the discussions. But between the agricultural and daily press, the publication and distribution of the convention proceedings in pamphlet form by the state the vast fund of information there brought together is of great worth. Better, the movements initiated which have lead in some cases, to great good to the fruit interests of the state are further justification for continuance of these conventions.

* * *

Parcels Post—Edward Berwick believes in pulling on one string and hollering for every body else to get a hold and pull to. At present it's parcels post. In season and out of season at the State Fruit Growers' Convention Mr. Berwick has promoted his pet theory. Well, its a good thing and we believe worthy of pushing. It will certainly be a great benefit to the rural class—we believe it will benefit all the people, it will be a good thing for the nation. Great Britain has a better postal service than the United States has. There an eleven pound package may be forwarded anywhere within the kingdom for 24 cents free delivery anywhere within three miles of depot.

If the American farmer could send, for such extremely low figures, his higher priced, lighter articles and receive merchandise deliverd to his door there must be great benefit. For instance, Fresno could secure immense extension of market for raisins if it could advertise and send all over the United States fancy cartoons of raisins for say six or eight cents. California flower trade could be developed, seeds and plants freely sent and other benefits readily seen. But can the government afford it? Great Britain does and last year had a net profit in its postal department of over $20,000,000.

* * *

The Farmer's Taxes—In another column of this paper may be seen reference to a paper read at the Fresno Convention by Hon. John Tuohy of Tulare, in which a claim is made that formers pay far more than their just proportion for the support of county, state and national government. Such a statement should attract attention at this period when the farmer goes down the steps from the tax collector's office with an empty wallet in his pocket and bitterness in his soul. Thousands of well salaried men live in fine homes and enjoy the protection and benefits of government and all the luxuries which it brings, yet pay not one cent of taxes. Other thousands, through evasion and falsehood escape with only small proportion bearing their part of the load. But the farmer—he's "easy." Every article on the farm from the old setting hen up to the old bay mare has got to be listed. The writer of this knows of a national bank in California with a capital of $50,000, deposits reaching hundreds of thousands and paying taxes on —— $500. Yes, five hundred, no mistake in the figures. Of course there were government bonds, and the savings bank turn, also other twists which made it appear that even the $500 was almost unjust. Poor bank.

Meantime the farmer, if he goes to Sunday-school, says nothing and pays taxes. If he doesn't go to Sunday-school he says things and pays taxes.

What are we going to do about it? Ask some one else. The Cultivator doesn't know.

As a hint, though, we might say it might be well to form more farmers' clubs, get together and talk a little and think a lot.

Hon. Geo. C. Pardee, Governor of California, appeared before the State Fruit Growers' Association and made a ringing speach which will make every Californian proud of the state and every fruit grower proud of his calling.

If Columbia is really marching an army to invade Panama, she will have the experience which effort brings—nothing more.

STATE FRUIT GROWERS' CONVENTION.

(Continued from first page)

any one of which would bring success.

If the plan of the Raisin Association is not adapted to the larger needs of the producer of prunes, peaches and apricots, or if through the mismanagement of the board of directors of the prune association that plan is discredited, why not take as an eminently successful model the best of the labor organizations? Create local centers of organization all over the state where deliveries are to be made, and let the packing of the fruit be done by those who produce it. The local organizations to create a central board of delegates which through inspectors shall enforce a uniform standard of packing that shall command the confidence of the trade, and create a valuable trademark. This central board to have the sole control of prices and the distribution of the fruit. The proceeds from sales to be sent in lump sums to the various local organizations to be by them paid out to the farmers.

This need not interfere in any manner with the sale of the fruit through the present established channels of trade. It simply reserves the packing and—a very important point—retains the possession of the fruit in the hands of the growers until paid for.

No self-respecting man or body of men, can say that because of failure once, twice, or a dozen times, they need not try again. I hope, therefore, that on this day and by this convention, a movement will be started that will redeem our characters as intelligent and enterprising men, and through its resultant prosperity our fruit growers will add their quota to the renown of this glorious state—California."

* * *

Mr. Kearney's paper had some points which plainly reflected on the management of the California Raisin Growers' Association and D. D. Allison, a member, responded with considerable heat which made things look smoky for a few minutes when several members called for order, and as one member from Tulare said, this State Fruit Growers' Convention is no laundry for the purification of dirty linen.

A. R. Sprague spoke on Possible and Impossible Co-operation. Co-operation amongst California fruit growers is necessary to best results in marketing fruits. Success will be due to confidence in eastern trade and confidence in the membership and in the management. The speaker's idea is that there is abundant ability to manage if the growers will but get together and stay together.

C. D. Harvey spoke on co-operation—the whole evening's program was in fact along the line of co-operation. The greatest disaster comes to the growers as the result of distrust and discouragement. As an organizer of such movements he found the greatest difficulty in establishing confidence. The grower looks with distrust on such movements and withholds his support. But past failures should give lessons which will lead to future success. Mr. Harvey's work has resulted in establishing co-operative packing at Edenvale; East Side, San Jose; West Side, Santa Clara, Campbell and Willow Glen.

In the discussion it was brought out that the raisin output of the state will aggregate this year about 48,000 tons of raisins, or nearly 6,000 in excess of former crops. For this the money has been paid in the shortest time. Already $2,000,000, or about half of the total amount, is paid over.

Mr. Coombs, of Lindsay, Tulare county, ended the evening in a whirlwind of fun by telling some catchy stories and appealing for a co-operation which should cover the whole state and the whole range of products.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

THE GROWERS' EQUIPMENT.

An article in the Fruit Trade Journal of New York, among other slurring references to the work of the California Fruit Agency, makes exceedingly light of the fact that the agency is sending a representative to England and the Continent to work up a trade on navel oranges. It seems a great error on the part of the disgruntled commission merchants of the East, for the fruit growers of California, through their agency, to spend a few hundred dollars in exploiting new markets. The Journal estimates the crop of Valencia oranges this season at 8,000,000 boxes. "Think of trying to make a business of bucking this proposition with California navel boxes, on which the freight alone is, or was, $1.50 (to British points)." Of course we do not expect the commission men's organs to be favorable to any growers' organization which is selling its own fruit. That very fact places the California Fruit Agency without the pale of sympathy or toleration of the commission men. The organs only take an occasion like that of exploiting the British markets, for the purpose of casting general ridicule upon the marketing agency that is taking away the commissions. But it is to the Journal's prating about the experiences of exploiting new markets and the cost of equipping the Agency that we wish to give attention.

Year after year the Fruit Exchange has demonstrated its ability to market fruit at less than half the cost of selling through the commission men. I have referred to this fact time and again through the columns of the Cultivator, giving figures to prove the statement. Fortunately we have a living example of the cost of selling commodities upon a commission basis, in the walnut association, which pays one commission firm $50,000 to $60,000 for selling each crop of walnuts. Upon this basis it would cost the citrus fruit growers nearly a million dollars to dispose of the present crop upon a commission basis. This is where the shoe pinches. The California Fruit Exchange is doing business for its members upon the basis of actual cost, whatever that may be, and the California Citrus Union is doing business for its patrons upon a contract price per box, fair, reasonable and at a great reduction from the former cost of the same service to the same people. It is a flat rate of so much per box for packing and selling in the latter case, and actual outlay in the former. In neither case do the commission men get to handle this fruit unless it may be under the eye of a representative of the Agency. This is a perquisite killing, honest returning arrangement which will be sustained in spite of the opposition of the men who formerly handled a large portion of this fruit upon a percentage basis.

To the erstwhile commission takers we may proffer a word of advice. Get on to the facts that you still have a vast majority of the farmers of the country to feed upon, but you have lost the Southern California contingency forever; you are now the only considerable body in opposition to the plans of the California Fruit Agency and your opposition will prove as fruitless as your position is lonesome; you should keep yourselves warm and well nourished and free from worry; you should become aware of the fact that the farmers of this part of the state are not dependent upon you in the least and, consequently, you have no way of reaching them in your wrath. The success attending the farmers' cooperative movement has proven again that the fittest survive, and you not being of that degree of fitness to stand, have already perished from the citrus belt of Southern California; that we parley with you only because there are a few of us who have not discovered your demise and they should be reminded that you are in the condition of the proverbial door-nail.

WEATHER AND CROPS.

Cool weather prevailed throughout the state most of the week, with heavy fogs along the coast and in the great valleys a portion of the time. Light frosts were frequent in nearly all sections and severe frosts occurred in some places, but caused no material damage. A minimum temperature of 28 degrees was recorded in Santa Maria on the 5th. High winds in Southern California injured orchards to some extent, and drying winds in that and some other sections absorbed much of the moisture in the soil, rendering irrigation imperative. Light rain fell in San Diego and vicinity Sunday night.

In the northern portion of the state the soil is in excellent condition, and farm work is progressing rapidly. In other sections the rainfall has been generally too light for farming operations and plowing and seeding are backward. Early sown wheat and oats are thrifty and making good growth in the central and northern sections, and green feed is becoming plentiful, but in most of the southern districts grass has made no growth and rain is needed soon. Stock are in fair condition and steadily improving.

Orchards and vineyards are in good condition and pruning is in progress in many places. Oranges in the Porterville and Oroville districts are yielding a good crop, excellent in quality, and large shipments are going forward. Southern California oranges are ready for harvest and shipments have commenced. The crop is reported large. It is probable that oranges were damaged by the severe winds in Southern California. Other citrus fruits and olives are doing well.

JAS. MILLS, Mgr. RIVERSIDE, CAL.

RIVERSIDE NURSERIES, Riverside, Cal. Fullerton, Cal., Oct. 24, 1903.

Dear Sirs—It is with no small degree of pride that I point to the orange orchard that I set out in June, 1902, with stock from your nurseries. I am not acquainted with any orchard of similar age that has done so well, and is today so promising. This certainly speaks in no uncertain language of the character of the stock coming from your nurseries. Very respectfully, CHARLES CHAPMAN.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

FUNGUS DISEASES OF TREES AND THEIR TREATMENT.

Throughout the great pear growing section, along the Sacramento river, the fungus disease known as pear scab, pear cracking or leaf blight, has been so bad during the past season as to very materially reduce the crop. This is one of the great group of fungus diseases, which are usually prevalent during damp seasons, when the best conditions are afforded for their growth and distribution. The group contains some of the most destructive and difficult diseases which the fruit grower has to contend against, among them the shot-hole fungus of the apricot, the curl leaf of the peach, apple scab, brown rot mildew of the grape, and many others. These all flourish especially well during the early spring months, and continue late into the season unless their growth is checked by hot, dry weather. It has been on account of the past season being unusually cool and moist, along the Sacramento river section, that the pear cracking has been so bad. The pear cracking is sometimes confounded with or mistaken for pear blight, which is altogether a different thing, due to different causes and operating in a different manner. The pear blight is bacterial in its origin. It is caused by the germs, or bacteria, being introduced into the tree from some outside agency, frequently by insects, which, flying from diseased trees to healthy ones, carry with them the fatal bacteria and inoculate the healthy trees. Its point of entrance is usually through the blossom, working through the blossom stem into the fruit spur and thence into the branches and down into the trunk. This disease works wholly in the cambium layer, or the sapwood, and is entirely hidden from sight, only becoming visible when it breaks out on the surface. It is impossible to reach this disease with any remedies, for this reason that it is wholly within the tree and not alone on the surface. With pear scab it is different; this disease, in common with the whole fungus group, is wholly a surface disease, and can be reached by sprays and its course checked, if not altogether stayed, if it be taken in time. It is of little use spraying when the disease has made its appearance, however, as then the damage has been done. When a peach tree is covered with curl leaf, it is a waste of labor to attempt to cure it; it cannot be done. The same is true of pear scab. When the disease makes its appearance on the newly formed fruit, with minute red spots, it is certain that the fungus is rooted in it, and while spraying may check its growth somewhat, the fruit will be ruined in any event and the fungus may as well be allowed to have its way. Therefore, in this class of diseases, all remedies must be preventive. The grower must act on suspicion and spray when there is no evidence of disease present. If he has discovered any fungus diseases in the fruit the preceding season, or knows of any in his vicinity, he may be pretty sure that the spores have found lodgment on his trees and are only awaiting favorable conditions of warmth and moisture, which the spring will bring, to develop into life and spread with wonderful rapidity over fruit and foliage. All fungus diseases originate from spores, a minutely fine dust, which is the seed of the plant. This is shed by the parent plant in the fall and is carried by the wind in all directions. Some of it finds lodgment in suitable locations on the twigs of trees suitable to its growth, and here it remains dormant until the favorable conditions of the spring awaken it into virulent activity. The remedy is to deaden these spores at the period of their least resistance and when they can be most easily reached, and this is during the period of dormancy. To accomplish this all diseased fruit should be burned as a precautionary measure, thus preventing the shedding of vast amounts of spores, then all prunings should be burned as soon as removed from the trees; this is also precautionary. The next measure is to use a spray that will destroy the spores and for this purpose a solution of sulphate of copper, the best of known fungicides, has been found the most effective. This solution combined with lime, which prevents injury to the trees, is known as the Bordeaux mixture and is prepared as follows:

Copper sulphate (blue vitrol) 4 pounds.
Quicklime (not air slacked) .4 pounds.
Water, to make ....50 gallons.

Dissolve the copper sulphate in about two gallons of hot water contained in a wooden vessel, by stirring, or even better, by suspending the sulphate contained in a cheese-cloth sack in a large bucketful of cold water. With the cold water and cheese-cloth bag a longer time is required. Pour the sulphate into the barrel or tank used for spraying, and fill one-third to one-half full of water. Slack the lime by addition of a small quantity of water, and when slacked, cover freely with water and stir. Pour the milk of lime thus made into the copper sulphate, straining it through a brass wire strainer of about thirty meshes to the inch. Pour more water over the remaining lime, stir, and pour into the other; repeat this operation until all the lime, except stone lumps or sand, is taken up in the milk of lime. Now add water to make 50 gallons in the tank. After thorough agitation the mixture is ready to apply. The mixture must be made fresh before using and any left over for a time should be thrown out or fresh lime added.

This mixture is of strength designed for winter use when the trees are dormant; it is too strong for use when the trees are in leaf as it would burn and destroy the foliage, a much weaker preparation is then used which may be designated as Bordeaux No. 2, and is in the following proportions:

Sulphate of copper ....2 pounds.
Quicklime ....2 pounds.
Water, to make ....50 gallons.

For pear scab this should be used in the winter before the buds begin to swell and the mixture should be of the full strength. A second application, and this time of the weaker solution, should be made when the leaves are out, and about two-thirds grown; a third application may be made if it is thought necessary. This remedy and method of using it is practically the same for the whole group of fungus diseases and may be applied for curl leaf of the peach, shot-hole fungus of the apricot, etc.

DECIDUOUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

BEST PEACHES FOR ANAHEIM.

Editor Cultivator:—Will you kindly let me know which you consider the best four peaches for this locality, something that will prove a fairly regular bearer, not subject to dying back, varieties which will leaf out when peaches ought to leaf and not wait until July, as sometimes happens. Will any kind of orchard trees grow where old peach trees have been taken out? I have taken out some peach trees and reset with peach trees but have not succeeded in getting good growth though I filled the hole with dirt brought from a distance. Do you know where I may get table varieties of grapes grafted on Lenoir roots.—Subscriber, Anaheim.

We think the four best varieties of cling stone peaches are Sellers, Phillips, Yellow Tuscany and Henrietta. They are all good yellow clingstones. All things considered, Heath's cling is the best white cling. It is hard to designate with any degree of fairness the four best free stones. We would feel contented if we had nothing more than a good supply in their regular seasons, of Crawford's Early, Large Early York, Pansy Pabor and Wiggins. These are always later than the southern peaches in blooming, but they are fairly reliable. Those which will start to grow as soon as the proper season arrives, are found in the southern varieties. Angle is a good early one. Early Cream, Triana and Countess fill out the season very well. The last four named will invariably leaf out and bloom at the proper time, but they are very subject to curl leaf and if not sprayed with Bordeaux mixture at least once in two years, very little fruit will survive.

It is very difficult to start a young peach tree where an old one has been taken out. In fact it is hard to start any tree and make it grow off at a good pace when planted so. The soil has been well worked out in such spots. The best way to secure good growth under such circumstances, is to add a good lot of nitrogenous material in the bottom of the holes and feed it to it as the tree grows. A good mulch of stable manure will help out better than anything.

We do not know of any table varieties of grape on Lenoir roots nearer than Fresno, though inquiry at the various nursery yards may locate some.

* * *

FERTILIZER FOR STRAWBERRIES

Editor Cultivator: What is the best fertilizer to use for strawberry plants, and when is the best time and how best to apply. My soil is a sandy sediment, rather heavy, plenty of water.—N. H., Covina.

The fertilization of strawberries is a question that has not been settled or even tried in a systematic way in this state. We know of no best way to apply it, nor can we give any definite rule that will be a good guide. The strawberry is a ravenous feeder and roots shallow, hence the application need not be much below the surface. We should judge that a superphosphate, sulphate of potash and plenty of stable manure would give excellent results. All of these ingredients are soluable in water and will be taken down readily into the soil. We would apply them in the winter so as to get them at the roots when they make their rapid spring growth. Experiments of value could be made along these lines.

CITRUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

GRAFTING OLIVE AND ORANGE TREES.

Editor Cultivator: Please tell me the time of the year to graft olive and orange trees.—Albert Glaser, Healdsburg.

Olives may be grafted any time from early in May till midsummer and perhaps until later. They are continuous growers and may be grafted whenever the sap is flowing freely. Good success may be had by machine grafting such as is often done in vineyards.

Orange trees should not be grafted. Failure will almost surely follow. Bud the tops on the old limbs, as soon as the young growth gets a good start in the spring, which usually happens some time before May. At the time of budding, all of the main branches not required in budding, should be sawed off and the wounds waxed over. The buds should be slipped under the bark in a circle at the point where the new top is to be started. They should be slipped in at the lower end of the slit that receives the bud, as this method prevents the rain and dew from trickling down the incision. The buds should be wrapped with strips of stout cloth coated with beeswax. If the spring is cold and backward, leave the wraps on for at least six weeks. Four weeks are long enough if the spring is warm and the growth is rapid. In locations where there is no danger of severe winter frosts, the tops may be removed at the time of taking the waxed cloth from the buds. At the same time, the stumps should be waxed over and the trunks whitewashed. Numerous sprouts will start out all over the trunks of the trees, but these must not be allowed to grow. The whitewash, if put on thick enough, will prevent sunburn and the sprouts do nothing but take the sap that should be used by the buds that are to make the new top.

After the young top has grown to be about 18 inches tall, the tips of the young shoots should be cut off. This will slightly check the growth and cause the shoots to branch. When they make a still further growth of 18 inches to two feet, they should be topped again. If the shoots from the buds are allowed to continue growth without interruption, they will become top heavy and break off by their own weight or will be broken by the wind. If the orchard is in a windy location, the new top should be tied to stakes, even if they have been topped. Some cut them back before the heavy winds set in; other growers drive stakes and tie to them. We have seen good results by nailing light stakes to the main branches, so that they will stick up through the new top and form a steady support. We do not advocate such savage treatment of trees as a general rule, but we have seen it done and the year after the nails were drawn from the trees, no sign of injury could be detected.

If the location in which the trees are grown is subject to severe winter frosts, the tops should be left on the trees until the buds have made the first year's growth. At the time of removing the bands from the buds, the branches should be girdled about half an inch above the buds. The top will continue to draw a little sap and during the following winter frosts will act as an umbrella. The following spring, a year from the time that the buds started, the tops should be sawed off and the stumps waxed. No tying to stakes will be required to prevent breakage from wind, but, should this be anticipated, the buds may be tied to the tops during the first year.

NOTICE OF MEETING.

The annual meeting of the members of the Apple Growers' Association of Los Angeles County will be held at Room A in the Court House, Los Angeles, on Saturday, Dec. 19th, at 10 a. m. Programme will be, election of officers for the ensuing year. A consideration of the question and possible benefits of incorporation. Fred'k. Maskew, Sec'y.

The Farmers' Tribune has established a reading coarse for the winter evenings. The idea is a good one. A variety of literature tends to broaden the mind and, at the same time, furnish most pleasant recreation for the family circle. Add to good books some jolly game of innocent character before retiring for the night and sleep will fall as gently as a summer song.

NO EXCEPTION

Last year we said the Tilton Apricot was a regular bearer. NEVER FAILS. This year is no exception. Every tree bore heavily; old ones as well as the newer planted orchards.

Fifteen Years' Test

and still the

TILTON APRICOT

Is a winner. Large, highly flavored, good color. In the dried fruits the Tilton won First Premium at the Great Central California Fair. Liked by canners. Original tree 18 years old near our nursery. Buy trees where you can get true to name buds from original stock from the Original Tilton Nurseryman. A thrifty lot of peaches and other deciduous trees.

J. W. BAIRSTOW, HANFORD, CAL.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A. B. C. OF INSECTS

(Continued)

As we all will remember, the names of the orders of insects are founded on peculiarities of wings. We have discussed the Neuroptera or lacewings, the Orthoptera with their thick front wings which are known as tegmina, the Hemiptera with their primary wings thickened at the base, making them appear like half wings, though as we will remember, one suborder, Parsitica, have no wings, and the second, the Homoptera have the four wings thickened all alike and none thickened at the base. The bird lice, of Mallophaga, are also wingless, while the thrips, or Thysanopter (tassel wings), have very simple wings, all with very broad fringes. The Coleoptera, or beetles, have sheathed wings, or elytra. All of the winged insects treated so far, if we may except the male coccids, have four wings. We now come to a marked exception in this respect.

* * *

DIPTERA.—As we would infer from this name, the insects of this order possess only two wings. These are the two winged flies. The wings are membranous with a rather simple venation. Here belong such familiar insects as the common house-fly, the annoying mosquito and gnat, the Mexican orange fly, and the terribly destructive Hessian fly and the wheat and clover midges. The mouth parts of these insects are greatly modified. They have a suctatorial beak, in which the labium especially and the mandibles and maxillae are largely developed. Unlike the bugs which they most resemble in their mouth organs, they do have one pair of palpi, the maxillary. That they can use these mouth organs with effect is evidenced in the mosquito, the cruel gnats and the tormenting horse fly. The transformations here, of course, are complete in the last four orders. As almost every one knows, the larvae in this order are known as maggots and they are footless. They are also different from other larvae in the structure of their mouth organs. Two little hook like jaws, which are moved backward and forward, tear the plant tissue and this enables the insects to absorb the juices. They also differ in the pupae state, where many of them pupate in their last larval skin, and are called pupariums. At this time they look strangely like a grain of wheat or other seed, hence the name flat seed state for the pupa of the Hessian fly.

The insects of this order are very varied in their habits. For the most part they do their evil work while yet in the inchoate state, though, as we know, the mosquitoes, house flies and cruel horse flies, are very annoying after they gain maturity. Many of them work on decaying matter and thus remove what would otherwise be offensive, as witnessed in the carrion and blow flies. Many develop in fungi, some live in the water, one family are very valuable parasites and two families do us great good as predacious insects. We also find here the curious bot flies which so disturb cattle, sheep and horses. Curiously enough, these bot flies have no mouth parts at all and so cannot harm the animals they annoy in the least. It must be simply nervous dread caused by their hum, which makes the animal which is to receive the eggs, so distraught. We also have in this order some of the most destructive insects known to man. The Hessian fly which blights the wheat plant, and the wheat and clover seed midges are second to hardly any insects in the damage which they cause. The Anthomyians, or flower flies do great damage to onions, radishes and cabbages, while species of Tterpeta blast the hopes of the apple and orange orchardists. The sheep tick, which, of course, is no tick at all, and some curious lice-like insects which work on bees and birds, also belong here. Thus we see that this order forms a motley company although their structural affinities quickly decide that they belong to one great order. Linneas included the fleas in this order, but they are quite different from all others of the order. They not only have both pair of palpi, but they also have only simple eyes, in which respect they differ from all other insects. Although this is a limited group it is so distinct that without doubt, it should be regarded as a separate order. Comstock groups these in the order Syphonaptera. As all well know, they are fitted for jumping and are nimble beyond compare.

There is one very important parasitic family of diptera. These insects are known as the Tachina flies, and they closely resemble the common house fly. They lay their eggs upon other insects and as soon as these eggs hatch, the maggot works into the host, and soon leaves naught but a deviscerated carcass. We can hardly measure the good that we receive from these Tachina flies. The olive caterpillar, which came as a flood into the olive orchards last year at Rialto, and a few years ago very generally in the state, were overcome, instanter, by the Tachina flies. One reason that we have the army worm only upon occasional years, is that they are held in check by these same China flies. It would be hard to measure the benefits that the gardener, fruit grower, and general farmer receive from these friendly parasites.

I will close this paper with a few words on the predacious species. There are two families of these. The robber flies—Asilidae—are either black or gray-black with long tapering bodies, or else robust and yellow like bumblebees, which they closely mimic. They are very fierce and do immense good, though unfortunately they are not as discriminating as we could have wished, for the honey bee often becomes a victim of these large hungry flies. The other family consists of the little quick, beautiful Syrphids. These little, often striped yellow and black flies also mimic bees and wasps. They are often seen about flowers in company with bees, and dart from one flower to another like a ray of light, so quick are they on the wing. The larvae of these are cone-shaped and are fierce enemies of plant lice, which they often devour in the spring of the year by the millions. Their pointed mouth end makes it easy to stab and suck juiceless the unfortunate aphids. Here again, we are under a great debt of gratitude to these Syrphid maggots.

* * *

IMPROVEMENT SOCIETIES.

These are the old Farmer Clubs under a new name. No matter for name if the work is up to standard. At Compton and El Monte, strong organizations were formed and equipped for work. There is happily a greatly renewed interest in such organizations. People begin to realize, as never before, the value of such organized effort It is the purpose of the conductor of our Farmers' Institutes to aid and encourage this work to the utmost. Its furtherance means better work, a better social status, better and cleaner politics, and the securing of needed reforms.

* * *

LATE INSTITUTES.

The Compton and El Monte Institutes were away up to the front in all respects. The first was among the very best. The Chino lacked support. It was stated in excuse, that most ranchers about were renters, and so took little interest in improved methods. A few present showed great interest, and were eager for information. A paper on the Dairy at Compton, by Mr. Moore, at Chino; on Alfalfa, by Mr. V. Gustafson, and at El Monte, on Walnut Culture, by Mr. P. F. Cogswell, were most excellent.

* * *

THE FARMERS' CLUBS INSTITUTE.

This meeting at San Diego was a most pronounced success. If we except Pomona, and possibly that is unnecessary, I think this ranks in most respects as the best. The local arrangements were superb, the local attendance all that could be desired, the music the best we have ever had, the program and discussions were of a very high order, the spirit of the entire meeting was admirable, and the yacht ride on the bay and the splendid banquet the last evening, with music and happy responses to toasts was a most fitting conclusion to what will long linger in the minds of the visitors.

* * *

BEES IN CALIFORNIA.

E. B. Maurer of Ontario asks the following questions regarding bees: "Can pure Italian bees be obtained anywhere in Southern California? What hive is best for this climate, and what locality is best for this industry? There can be no doubt but that pure Italian bees can be had in our state, though it would be as easy to send East for these as to get them at home. As is well known, the easiest way to get Italians, is to introduce an Italian queen, when soon after, all the bees will be of this race. As queen bees can be sent safely, the country over, or even around the world for the expense of a simple postage stamp, we see that we are not limited in locality when we may wish to purchase. If. Mr. M. wishes to purchase near home, I suggest that he write to his county foul brood inspector, Mr. R. B. Herron of San Bernardino, who can doubtless inform him where pure Italian bees are to be secured.

I think no better hive exists than the common Langstroth hive with Langstroth frames. These are not only excellent for all purposes, but as there are more of these hives than any other, it is better for all to secure them. It is quite desirable to have the hives most in use, as in selling and buying bees, such uniformity is very desirable.

As to the best locality, that is hard to give. I think that taking the years together, the bees have done the best in the region of Newhall, where Mr. Mercer has secured his enormous crops. Mr. Mercer sports a $1200 automobile, secured for but a small fraction of last year's honey crop. One can hardly go amiss of good localities, however, in any part of Southern California. Of course he should be in a region of abundant sage and wild buckwheat, and if abundant orange orchards and vast alfalfa fields are hard by his locality will have more to recommend it.

* * *

BLUESTONE, OR COPPER SULPHATE.

J. W. Duckworth, Loara, Cal., asks for the amount of bluestone in washing seed or any grain to guard against smut. Although I used bluestone on my father's farm, when a boy, I do not remember the exact proportions, but I do not think these are very material, as the bluestone is quite cheap. We know in Bordeaux mixture, abut one pound is used to ten gallons of water, and for soaking seed, we cannot make any mistake in using it at this strength or even stronger. I should not hesitate to use one pound to five gallons of water, and should expect all the spores to be destroyed. I think it is very important to use this copper sulphate very freely in any such case as planting asparagus seed, where there was as yet no rust. I should certainly advise getting seed from rust-free localities and should then use the further precaution of soaking the seed in bluestone water. I certainly hope that in the regions of Imperial and Coachella, these suggestions will be quickly followed. I am aware that Prof. Smith thinks that in those dry regions the asparagus rust will gain no foothold, but it is a matter of such tremendous importance that I urge upon all farmers there to take particular caution against this insidious foe of the asparagus beds.

* * *

DRY SPRAYING OF FRUIT.

Subscriber from Los Gatos, Cal., asks for further information regarding the use of dry spray in the orchard. This referred to dusting the orchard with poison rather than putting it on mixed with water. I have used the Woodason dust bellows not a little but do not think it begins for general practice with the liquid spray. Thoroughness must be the watchword and it is difficult enough, even with a good spray pump run by power to do thorough work. It might pay in case of red mite to use the best dust bellows, thus supplementing the distillate spray. I believe Subscriber can do nothing better to eradicate his scale and remove the black fungus of smut than to club together with his neighbors and purchase one of these spraying machines. They are giving great satisfaction in this region and new ones are being sold each day.

Coast News and Notes

BY R. A. DAGUE, COR. SUTTER AND SANSOME STS., SAN FRANCISCO

MISCELLANEOUS.

A cement plant to cost a million dollars is to be erected at Santa Cruz.

The records show that last month was the most stormy November California has had for fifty-five years.

Several fatal cases of ptomaine poisoning have recently been reported in California from eating canned meat.

Lake is one of the finest counties in California, but very montainous. It has no railroad, but a movement has been inaugurated to build one.

According to the figures presented by the Southern Pacific, that company has located between 5000 and 10,000 persons in Oregon since last spring.

The Southern Pacific is building an immense loading rack in the Coalinga oil fields. It will have 32 spouts and two tanks of 55,000 barrels capacity each.

The statement is made that 10,000 girls are wanted in Kansas to take positions in families to do domestic service. The same might be said of nearly every state in the Union.

The announcement was made one day last week by the government, that the cotton crop of the United States for 1903 will be 9,962,039 bales of an average net weight of 490.3 pounds.

A German has invented an instrument which he calls an Orthodiagraph by which he can take a photograph of all the intestinal organs of the human body.

A co-operative organization of importers of the United States is being organized. Already more than 200 large firms have agreed to become members.

Francis McCarthy, a fifteen-year-old boy of San Francisco, through friends has applied for a patent for a system of wireless telephoning. It is a great discovery.

The Spring Valley Water Company of San Francisco has decided to issue bonds to the amount of $28,000,000. They will bear 4 per cent interest, payable semi-annually.

The proposed house of 1000 rooms to be erected by J. A. Kinghorn Jones, in San Francisco, is not to be erected on the building and loan association plan, as stated two weeks ago, but the plan has co-operative features.

J. A. Filcher, of the State Commission to the Louisiana Purchase Exposition, has arranged to have September 4, 1904, California Day, at the St. Louis World's Fair. California is the first state to have a day set.

The Harbor Commissioners of San Francisco have revoked the permits of four firms which allowed them to do business at the wharf, on the ground that they have violated the Woodward law.

It is asserted that Professor Loeb of the State University, has produced a skeleton of a new hybrid by fertilizing sea urchin eggs by the sperm of the star fish. This, it is said, indicates that a cross may be made between two different species, which possibility has never been conceded by scientists.

A great discovery has been made by James Dennis, of Richmond, Indiana. He is manufacturing bricks of fuel from clay and a chemical known only to himself, which furnishes a steady, lasting heat that will not cost half as much as coal. A company is to be formed to manufacture the fuel.

The late decision of the Supreme Court in the case of Katz vs. Walkinshaw has created wide-spread interest among farmers and water companies. The gist of the decision is that one man, or a corporation, does not have the right, even on his own land, to divert percolating water. Water companies cannot utilize water from mountain or valley by diverting it from its natural course.

It costs the state $250,000 a year to run the San Quentin prison and $120,000 to run the Folsom prison. It costs the seven counties of Southern California $13,689 transportation fees to send these prisoners to the penitentiaries named. The proposed new prison in San Diego county would cost the state $1,000,000.

The Inter-State Commerce Commission has decided to hold at Washington the final hearing on the California fruit forwarding case on January 14. On that day, representatives of the fruit growers, Southern Pacific Railroad and Santa Fe Railroad will appear before the commission to present arguments, and soon afterward a final decision in the case will be announced.

AGRICULTURE.

The farmers near Hollister are planting red oats extensively. But little wheat is being sown.

Mrs. H. D. King, of Texas, owns the largest farm in the world. It contains 1,000,000 acres, worth $25,000,000.

It is asserted that the Armours have cornered the potato crop of California, and are shipping the potatoes East.

The Dervin cannery, of Healdsburg, packed 35,000 cases of tomatoes this season for the Rochdale Wholesale Company.

Government seeds are being sent out by Senators Perkins and Bard, and California congressmen. Write them if you want any seeds.

A movement is on foot to raise 400,600 to be expended in erecting a sugar beet factory at some point in the Sacramento valley not yet decided on.

According to the Stockton Mail, L. A. Phillips and J. K. Toles are preparing to plant flax on their reclaimed lands. They will also erect a mill and produce linen fiber.

Harvey C. Stiles, of Chico, says an active committee is working with the Government, with a good show of success, to have the government seed gardens located there.

W. H. Hennage, of Point Arena, Mendicino county, informs the Cultivator that his county never produced a finer, sounder and more perfect apple crop than was grown this year.

Prunes are beginning to move at Ukiah. A few days ago Henry Smith sold twenty tons at $55.00 per ton, and Hugh and Edward Cox contracted their crop from ten acres for $3000.

J. H. Gray will divide up his 131 acres in Rincon valley into small tracts and put on the market. It is all highly cultivated. This tendency toward ten and twenty acre farms is growing.

About 1300 car loads of apples at this writing have been shipped from Watsonville this season. The shipments have been divided between San Francisco, Los Angeles, London and Liverpool.

The crops of Ventura county were immense this year. The ware houses are filled to their utmost capacity. One at Moorpark now contains over 67,000 sacks of barley, wheat, beans, dried apricots, besides 400 cases of honey.

A very valuable work on resistant vines and a discussion of phyloxera has been translated from the French and can be had by addressing Professor Edmund H. Twight of the Agricultural Department of the State University.

Professors P. H. Dorsett and Stubenrauch, with Wm. A. Taylor, of the Department of Agriculture, addressed the members of the Santa Ana Chamber of Commerce on the 28th ult., in relation to the location of the experimental garden site.

To prevent the co-operative association of the grape growers, the wine manufacturers have agreed to contract for grapes for three to five years at $15 per ton, retaining the right of the sugar test. The growers insist on being paid $20 per ton and abolish the sugar test.

A colossal co-operative movement of farmers has been launched at Chicago. It is announced that 20,000 farmers of Oklahoma and practically all the farmers of Kansas stand ready to go into it. The managers of the movement say in due time they will have eight million members.

Mr. Wilson, Secretary of Agriculture

Arizona Everbearing Strawberry Plants
Well rooted, thrifty plants, grown on virgin soil, layered by hand, fertilized when runners started. L. H. EDMISTON, Riverside, Cal.

Coast News and Notes

CONTINUED

of the United States, says of our beet sugar industry: In 1896 19,260 tons of sugar were made, and a year ago 220,000 tons. Careful estimates put the present crop at about 260,000 tons. The growing of seed in the United States of a superior quality is assured.

HORTICULTURE.

A great many Santa Clara county farmers are planting olive trees.

The prune market in the Santa Clara valley is still very dull, but an improvement is expected after January 1.

The Santa Rosa branch of the California Fruit Canners Association has finished its pack for the season. They put up 153,024 cases.

The Grangers of Sonoma county, in a late convention, have unanimously voted in favor of establishing a cooperative fruit association.

Alden Anderson, manager of the California Fruit Distributors, says the association will keep its office open until next deciduous fruit season, but will handle no deciduous fruits this winter.

The Southern California Horticultural Commissioners will hold a meeting at San Bernardino some date this month, for the purpose of discussing ways and means for fighting fruit pests.

The prospects for a large crop of olives in Santa Clara county are good. The fruit will be large enough in a month to harvest for pickling, but will not be sufficiently ripe for oil before February.

A. R. Sprague, Manager of the California Fruit Exchange, informs the Cultivator that their total shipment of fresh and dried fruits this season was about 700 carloads, and of the Fruit Distributors over 7,000.

Judge J. H. Wills, of Auburn, says that Placer county can show oranges which ripened in the middle of October, this year, that could not be duplicated in size, color, flavor or commercial value in the state.

Citizens of Mendocino county resent the report that they cannot successfully grow prunes. W. D. White of that county, has a prune orchard that bears fruit that for size and quality compares with any prune raised in the state.

The principal almond growing counties are Alameda, Contra Costa, San Joaquin, Solano and Yolo. In these five counties there are 7,610 acres of almond orchards. The value of the average almond crop is $40,000, or about $41 per acre.

The marketing of oranges of Central California will be over before the fruit in Southern California is ripe enough to ship. The acreage of orange orchards of the northern and central part of the state is not large but the crop is very fine.

The San Francisco Chronicle recently sent a representative to the store of every retailer of fruits and vegetables in the city to get prices. It was found that a great many articles were double the price of that demanded in Oakland, hence the Chronicle's assertion that there is a combine among the retail dealers. This is in violation of the state law and the Harbor Commissioners have commenced to enforce the law.

The Earl Fruit Company has been reorganized and the place of business transferred from Los Angeles to Sacramento. The directors are five in number and are: Edwin T. Earl, E. M. Butler, George Carty and R. W. Poindexter of Los Angeles and M. M. Harding of Santa Ana. The capital stock is $100,000, $99,600 of which has been subscribed by E. T. Earl. Each of the other directors subscribed $100 each.

LIVE STOCK.

The sheep in Tehama county are freer from disease this season than for several years part.

During the past three months there have been shipped two to three carloads of poultry per week into San Francisco from the East.

A famine in milk and cream prevails in Santa Paula, owing to lack of rain and scarcity of feed. The output of the dairies has been greatly curtailed and cream sells for $1.50 per gallon.

At the meeting of the Petaluma branch of the Sonoma County Poultry Association, Saturday, it was stated that San Francisco commission merchants had threatened to obtain their supplies of poultry and eggs from the east, instead of patronizing the poultrymen's organization. The threat was treated as a huge joke by the assembled poulterers.

TEST THERMOMETERS.

Editor Cultivator: I noticed in one of the "Cultivators" that you advised those having incubators, to have the thermometer tested before starting the machine for the season. Will you kindly tell us through the Cultivator how this is to be done, and oblige one of its subscribers.

Very truly yours, Laura R. Keith, Campbell, Cal.

As you are living in a city the easiest way would be for you to take the thermometer to a drug store and ask your druggist to test it for you I, living too far from a druggist, take a 10-lb. lard bucket (or larger), fill it with warm water, about 103 degrees, get a clinical thermometer, or one I am sure is correct; put them into the water, keep it stirring and see if they are all the same temperature, and run the incubator accordingly. Some friends of mine bought a new incubator, put into it some $25.00 worth of eggs, and lost every one because the thermometer was two degrees wrong. The incubator company gave them another thermometer, but they lost the eggs.

—Mrs. A. Basley.

CATTLE IN THE SOUTHWEST.

J. G. Dardin, one of the big cattle growers in Texas, gives it as his opinion that the day is not far distant when the live stock industry will be removed from Texas and the southwest to the northwest.

A meeting of cattle growers was held at Santa Barbara this week and an organization perfected for the purpose of stamping out the Texas fever in that county. E. S. Sheffield of Santa Barbara was elected president and E. C. Tallant secretary. Representatives of like associations from Ventura and San Luis Obispo counties were in attendance and methods of co-operation were discussed.

Percy Whitehead has purchased the Jersey bull, Marigold's Orange Tormentor, advertised in this paper by Mr. Keefe, of Orange. Mr. Keefe has purchased three pure-bred heifers from George Thomas, of Riverside. Mr. Whitehead, in starting this herd of Jerseys, will be the first one in this section to become a member of the Southern California Jersey Breeders' Association.

C. H. SESSIONS, ASSOCIATE EDITOR

THE DAIRY.

The Institutes at Compton, Chino, and El Monte emphasized the importance of the Dairy. Two most important papers were given; one by Mr. E. E. Moore of Compton, and one by Mrs. Sherman. The three words pertinent to the dairy are "nice, 'nough and neatness." The cattle should be of far better quality. How quick we are to strike down any enemy that stands in the way of success. The trust that would strike down our business success, we would throttle if we could. The indifferent cow, or the positively worthless cow draws heavily on the profits from the balance of the herd. Why not kill her? Mr. Platt would have no cow that would not give an average of ten quarts of milk a day for the year, counting out the six weeks that she is dry. I would say ten quarts per day, not counting out six weeks or any weeks. Mrs. Sherman will keep no cow that will not, if mature, give 10,000 lbs. of milk a year. My standard is 7300. Every dairyman should have this mark to aim at. If he will make Mrs. Sherman's higher standard his aim, all the better. This is a matter that every dairyman should face. Use the Babcock test and the measure and the knife.

The cows must have good care, kindness, abundant good food. The loss in this direction is frightful. The returns from abundant food, succulent food, kind treatment, regular care in all lines would be startling in many a dairy.

The third point—neatness—is even more in need of attention. Mrs. Sherman says the barn should be neat as a parlor. The dairyman who would win success, must use plenty of whitewash, must sprinkle freely with gypsum, must have cement gutters, must keep all clean, must thoroughly brush the cow before milking, must never practice wet milking, and must use his nose to the effect that no tainting odors pollute his milk and spoil his product. The dairy can have no more necessary partner than absolute neatness.

Messrs. Sessions and Platt both emphasized the supreme importance of the most absolute neatness. This not only gives security for excellence of flavor, but also lessens the evils from harmful bacteria which find in milk their most coveted diet.

HUMANITY TO HORSES.

A pretty sure way to bring a horse's bones to the surface and fix in his mind the idea that "This world's a wilderness of woe," is, after a hard day's work, to drive him two or three miles to town, tie him in front of the store and let him eat "post meat" for an hour or two, while his owner is discussing national finance, the Panama canal, the Chinese problem or Turkey and the Powers, says Rural New Yorker. Many good horses have "gone to pieces" at 12 years of age because they have had to do so much overtime. They are not given the time for eating and rest that nature requires and are often tied in cold, windy places or drafty sheds, which tend to give them colds and stiff joints. Of course it is much better to avoid making a horse work so hard during the day that he cannot without injury be taken out at night, but the press of farm work often makes it necessary to crowd the team more than is good for them. At such times it is both economy and humanity to let the horses have the whole night to themselves.

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

Editor Cultivator: Is there any cure for a horse that has a slight, yellowish, partly decomposed discharge from the nostril. Occasionally, during the cold rains of last winter, but not lately, the matter assumed a slightly bloody tinge. Horse is in good condition and seems to experience no inconvenience save a blowing off from the nose especially when driving against the wind. The odor of the discharge is simply excrutiating to the human sense.

Also, can you give manurial value of cocoanut meal when fed to cattle compared with that of oil cake meal?

An answer will greatly oblige.

There are hollow bony cavities on each side of a horse's head lined with a mucous membrane. When these become diseased and filled with pus, the discharge is very offensive and comes in spurts. The only way to cure the animal is to trephine and wash out the cavity. It is not a difficult operation and is almost always followed by a cure.

* * *

SORE TEATS.

Editor Cultivator: Can you tell me why my cow is troubled with sores on her teats difficult to cure. Some have been on there two months and just now commencing to heal, but she gets new ones. It at first is a little scratch, then it spreads and a big black crust forms.

Make an ointment of one ounce of vaseline and one drahm of Squibbs' compound alum powder. Rub a little on the teat after each milking.

Cutter's Black Leg Vaccine

California Stockmen's Favorite

Used by 80 per cent of vaccinating stockmen in California. Early vaccination is good insurance. Write for description of our Black Leg Pills and Injector for using them. They are safer and easier used than either the string or powder vaccine.

The Elements of Successful Dairying

BY E. E. MOORE, COMPTON

This subject naturally divides itself into three main topics: 1. The man; 2. The location; 3. The animal.

It seems to be a popular idea that when a man proves a failure at everything else he should try farming and a few cows thrown in, to keep the family. While I do not hope in this short paper to exhaust all the merits of this subject, yet I shall be pleased if I am able to show that successful dairying requires talent of a superior kind, coupled with energy, and a never-flagging interest. These are qualities required in the successful prosecution of any and all businesses.

No one should hope to succeed in dairying who has not been more or less qualified, both by inheritance and surroundings. He should be a good judge of form and a keen observer of apparently trifling details, and the possessor of a good memory, or he can not hope to be able to select animals capable of producing the greatest returns. I think one of the most necessary requirements of a successful dairyman is a kindly, sympathetic nature, that would impel the owner to go hungry, rather than his stock. He should be a generous man, who will not stint his cattle, but willing to make any sacrifice for their welfare. He must be fond of young and a lover of pets. I have always noticed this last quality very prominent in the make-up of one of our most successful Los Angeles dairymen, when visiting my ranch. He always has a kindly word and a caressing stroke or gesture for every animal, especially the calves and tender young things. In fact, one must be a lover of his stock in order to bring out their best qualities.

Henry Drummond, the great English divine, has taken as the subject of one of his most powerful addresses: "Love, the Greatest Thing in the World."

Kindness in the handling of stock, and especially milk cows, will work wonders. Without it all the money of a Vanderbilt would prove barren of results, the bluest blooded stock would descend to the level of the meanest scrub, and the life of the dairyman "swallowed up in shallows and in miseries." Kindness and patience are better capital to invest in dairying than the wealth of a Rockefeller, else the rich would have a monopoly of the business. If a poor man possesses these qualities, in a superior degree, he is in better shape to succeed than the rich man, deficient in them, though of greater wealth and business capacity

The successful dairyman will be a great reader of dairy papers; for by them he will be saved many costly experiments, and helped over many quagmires which would engulf him if left to his own resources. Jas. A. Garfield once said that "he never talked with a man five minutes without learning something he had not known before." So with the dairyman; however great his experience, and however bright his genius, he must find great profit in the advice and counsel so generously provided in our many estimable dairy papers.

He must be a man of rare judgment and a keen observer of cause and effect in breeding, or his selection of dam and sire will produce no superior offspring.

I am a firm believer in the Shakespearean idea, "There is a Divinity that shapes our ends rough, hew them how we may." Every man has within him the qualities that will enable him to perform certain acts, more expertly than others. If after a careful and intelligent study of his native abilities he should believe himself adapted to stock-raising, the next thing to determine is a suitable location. Many a fine talent has been hidden or even shipwrecked by being used or applied upon the impossible. The first consideration for the location of a successful dairy is the ability to grow an abundance of succulent foods of a variety adapted to milk production. Without an abundance of available fuel the mightiest engine is useless, so the cow, without an abundance of food and drink, constantly available, will only be a source of disappointment and worry to her owner. If asked which I deem the more essential, feeding or breeding, I would reply, "Without feeding your breeding is useless, and without breeding your feeding is wasted."

In choosing a desirable location the availability of a ready market cannot be overlooked. Many a man possesses eminent qualifications for a certain line of business and may have a suitable location in every respect, but the distance to market or the expense of placing his product before the consumer may be so great as to eliminate every vestige of profit. As a well-known example, take the fruit growers of this state. Many of the brainiest men in the nation have settled here and planted an orchard or vineyard of choicest varieties, and cared for it till his trees were loaded with delicious fruit, only to see it rot on the ground for lack of a suitable market. I hope to see the day when the Isthmian canal shall furnish our coast cheap and rapid transportation to the great markets of our Eastern coast. But few people realize the importance of the events now transpiring, or what a glorious place this immediate section is bound to become within the next few years. With the completion of our harbor and the Isthmian canal, we will have equal facilities for disposing of our products with those east of the Rockies, and a soil and climate capable of producing from three to four times as much each year. The effect will be a rapid increase, not only in our wealth, but also in our population, thus enlarging our home market.

With the coming of the trolley lines into our country in every direction we are actually nearer the heart of Los Angeles than many who reside within her corporate limits. With the great markets of this rapidly-growing city within 15 minutes of our doors there is no reason why this section should not become famous for her splendid herds, and I firmly believe that such will be the case.

You have doubtless heard of the sensitive plate of the photographer or of the Roentgen jar of the X-ray machine, or of the needle in the mariner's compass. Did it ever occur to you that the cow is a more sensitive machine than any of them? Imagine what would be the effect if the doctor should give his X-ray machine a whack with his pill-case. Yet it is not an uncommon thing to hear of some would-be dairyman pounding his cow around with his milking-stool. It is no wonder he growls about his test and thinks his cheese factory-man or creameryman is buncoing him out of his stool-extracted earnings. The reason why—the cow requires more care and intelligence and kindness than the photographer's plate.

By this time I am almost persuaded that the chief element to successful dairying is an intelligent man. But let us continue the discussion of the animal. Don't think for a moment that I am going to laud the Jersey cow above all the rest, simply because I am the proud owner and breeder of some pretty good and pretty famous and pretty pretty Jersey cows. I am like St. Paul in at least one respect. I will "let every man be fully persuaded in his own mind." Having chosen a breed which your judgment tells you is best adapted to yourself, your locality, and your market, then have the grit to stay by your decision at least till you are satisfied beyond reasonable doubt that you are wrong. Keep only full bloods; that is, if your pocketbook permits. If not, then get a good sire and a few equally good females and start in on the never-ending task of building up a herd. I say never-ending, and I mean it.

For many years it was declared that the two-minute trotter was a creature only of fancy. The world went wild when Cresceus made his record approaching that long-desired limit. When at last that marvel of horse flesh, Lou Dillon, made her wonderful record, the world took a long breath and sat down contented, thinking this would never be excelled, only to be speedily startled by the announcement that she had lowered her own record. So it should be in the breeding of dairy animals.

A brief summary of the requirements of the ideal dairy cow is perhaps pertinent here. I would have her, whatever its quantity or quality, persistent in the production of milk. The cow that does not give a vast amount when fresh, but throughout the year holds up to that amount, will at the end of the year show a greater profit for her owner than the one which starts in with a great flourish for a month and then gradually descends till by the end of the year it requires a decided effort to get a showing of color in the pan. I would have a cow of equable, easy temperament, not readily disturbed or provoked, giving her flow of milk easily and without too great a time at milking. This cuts down the expense item and is far more satisfactory. In order to do this her udder must be well balanced—not too fleshy, teats good size, neither too large nor too small, and properly placed. I would have her low down, with large girth and good base to the brain. Then on the withers, catham, broad, springing ribs, showing no tendency to beefiness. Do not misunderstand me to be an advocate of the proverbial "bag of bones." I believe it possible to combine the beautiful with the useful. A conglomeration of boards, nails and shingles may form a building capable of performing a given service for its owner; but it would be much better if a little care and taste were exercised so that an ornamental as well as useful product of saw and hammer were the result. A man may wear even a blouse, hat and overalls in such a condition of neatness and taste as not to be repulsive. It is well that we pause in the mad rush of life and cultivate the bet-

ter side of our nature. It is well that a man provide a good house to shelter his family from the inclemency of the weather; but one's heart goes out in response to the show of feeling and taste exhibited by the lawn and shrubbery and sweet-scented roses with which he has beautified that home.

I have never forgotten a description I once read of the herd of Jerseys of one of England's most famous breeders. To describe one was to describe all: dark grays, with tan muzzles and great, beautiful eyes that looked with contentment and confidence upon the observer.

I have heard the gold prospector tell of the thrill and excitement attendant upon the uncertain hunt for gold. It seems to me there is no comparison to the thrill and pleasure and even excitement the careful breeder has in watching the outcome of his crosses. The gold hunter banishes himself from home, from comfort, from civilization, almost from life, without any assurance of any remuneration. The stock breeder is always sure of something, and if his foundation stock be properly selected, his pleasure and profit will grow with the years.

There is no business with fewer risks of failure than that of the care and breeding of dairy animals, and no better location under the sun than that of Compton.

MOLASSES AS CATTLE FOOD.

The experiment undertaken in Brooklyn, in feeding horses on molasses caused little surprise there, says a New Orleans correspondent of the New York Sun. Molasses has for two years been in general use in Louisiana for the feeding of horses, mules and all live stock, and probobly nine-tenths of the draft animals in the sugar districts get this food either alone or mixed with oats or corn. The animals like it, and are kept in splendid condition by it. "Sugar mules," which are fed on molesses mainly, are worth from 20 to 25 per cent. more than the mules on cotton plantations, which are fed generally on cottonseed and cottonseed meal.

Molasses has been a waste product in Louisiana ever since the improved processes in the manufacture of sugar have extracted more of the saccharine from it than formerly. It has been a problem how to get rid of it. The discovery, therefore, that it could be used as a food for live stock was of double value. Six months ago a factory was erected for the manufacture of cattle food from molasses. The process is very simple. The molasses is mixed with corn or oats in nearly equal proportions, the mixture pressed into a solid mass and dried, then ground into a fine powder. It is like the cottonseed meal with which cattle and horses are fed throughout the world. Horses, mules and cattle are very fond of molasses, and they do better on it than any other food. They keep fat, and are capable of extraordinary work in hauling heavy loads.

SWINE NOTES.

Young growing pigs crave a variety of food and it can be given them in slops better than in any other way. Even middlings and bran they do not relish as when made into slop.

The extra food digested all goes to profit whereas the food that supplies animal waste produces no gain in flesh, and if no more is fed than to supply waste in the young animals the food is practically all thrown away. Hogs are raised only for their flesh and the fewer days it takes a pig to accumulate enough to be of any considerable size, the more profitable it is for its owner.

As a rule sows that are kept too fat during gestation will farrow a litter of weak sickly pigs that are often hardly worth the trouble and expense of raising.

Very large boned hogs are not desirable on account of the waste or loss due to the unnecessary bone, besides such hogs do not usually have the best action and the limbs are not so strong as those of hogs with medium sized bone. The construction of large limbs are too loose.

No farm animal likes a warm bed better than the pig and unless he has comfortable quarters for sleeping no amount of food given him in cold weather will do anything more than keep him from losing flesh if it does that. To keep thrifty and growing during the winter, warm, dry quarters are absolutely necessary.

To think that a hog does not relish a clean bed is not to know the nature of the animal. He will walk a long way at night to sleep on a bed of fresh straw and to note the amount of satisfaction he gives, on finding a clean pen and a fresh litter of straw, is proof of his cleanly nature when he has the opportunity to exhibit it.

WHERE PROFITS GO.

Many dairymen wonder why they do not derive greater profits from their busines. They have not counted the cost of the cows in the herd that do not pay their keeping. That is where so many dairymen fall behind. Often it is the case that half the cows in a herd do not return in milk the cost of their keep. In the last quarterly report of the Kansas Board of Agriculture Secretary F. D. Coburn puts the matter in this way:

"If the man behind the cow in Kansas would do his part no unprofitable animal would masquerade under the fictitious appellation of 'milch cow,' and she would either go to the butcher's block or be made to return a profit by more intelligent care and management. It passeth understanding why theft by a cow should be tolerated more than theft by a human. In effect, the result to the loser in either case is the same. Our government has found it wise to study and establish far-reaching methods for the detection and the repression of the latter; and, by the same token, why should our farmers and dairymen be less vigilant in regard to this possible proclivity in their cows—beasts described as dumb yet outwitting their owners? So long as cows of this class are permitted in the dairy herd, so long will there be dissatisfaction and failure. Improvement is the route to success, whether by breeding, better management, or other ways, and intelligence in our cowmen is the power that will force advancement in the right direction. Dairying has come to be one of the most important factors in Kansas agriculture, and rightly conducted, is one of the surest money-makers of our varied industries. It is incomparably more rational than any one-crop system, or even general farming, as its practice tends to rotation of crops, maintains or increases the fertility of the land, and affords steady employment with return renumerative according to the brains mixed with the business."

MILK FEVER.

Editor Cultivator: I have noticed the articles on this question which have appeared in your paper. I have found that commencing milking the cow two or three weeks before calving to be the surest and easiest preventive. Besides, six weeks before calving, I stop all grain, and give raw potatoes—thus cooling the blood—a very important help. Generally speaking, it is only deep milkers which need these precautionary measures. L. W. W.

NOT SO BIG.

The types made us say, last week, that a young cow of Mr. Leffingwell, Jr., gives 16 gallons of milk a day, when it should have read "16 pounds of milk a day." Mr. Leffingwell has many finely bred cows, which give very rich milk, but has hardly reached that stage of perfection in his herd where any of his cows give a "wash-tub" of milk with a corresponding percent of butter fat.

KEEP CLEAN CHURNS.

If proper care is not exercised in keeping the churn sweet and clean the butter will be tainted, no matter how well the milk has been cared for before being ready for the churn, writes a correspondent in Farmer's Wife. Before beginning the work of churning one should have plenty of water on the stove so it may be boiling hot and ready for use as soon as the churning is finished. The buttermilk should be taken from the churn as soon as possible and the churn washed out with cold water, then it must be cloths in cold water, and then they should be put in a strong pearline suds and allowed to boil for at least twenty minutes, then they should be rinsed and hung out in the air and the air to dry, but not in the sun, thoroughly scalded and set out in as the sun warps the wood. If it needs sunning wait until the churn is perfectly dry and then set it in the sun. A small brush is excellent for cleaning the corners and crevices that are not easily reached with a cloth, and what is more important than the churn itself is the cloths used for washing and wiping it out. A churn cannot be made clean with a dirty cloth, and a cloth of this kind is one of the best known places for breeding disease germs, and these may be washed from the seams of the pans or corners of the churn. It takes only a few minutes to wash the few days, the cloths may be kept white and sweet smelling.

THE SAN FRANCISCO SHOW.

The poultry show is over and the coops are hastily being tagged for the Los Angeles show. Over 300 of these birds are going to try and win ribbons in that show as they have done here. It has been a fine exhibit of birds, a success financially, though not attended by the ordinary poultry raisers to the extent desired. The great drawing card was the dog display. San Francisco people came by the thousands to see the dogs, and incidentally they looked at poultry. Many poultry fanciers were there from all parts of the state. But the common, every day poultry raiser in the vicinity of such an exhibit should come to a greater extent than was the case here.

There were about 1400 chickens, turkeys, geese and ducks. There were about 300 pigeons. There were not far from 300 dogs—some magnificent animals. And then there were cats, we don't know how many.

Instead of comment on the quality of any poultry exhibited, we give better information below in the list of awards. One house, not mentioned last week, which made an exhibit—Sure Hatch incubators—by the Seattle Produce Co., Pacific Coast agents for that incubator.

1st Cock, 1st Hen, 1st Cockerel, 1st and 2nd Pullet, Santa Teresa Poultry Farm, Edenvale.

The Los Angeles Show

One of the most interesting and successful poultry shows in the history of Southern California is in progress in this city. More than one thousand chickens and ducks and turkeys and geese, all of royal blood, are on exhibition, and a magnificent show it is. There is almost every variety of bird represented from gobblers which weigh fifty pounds to the tiniest bantams that can be put in your coat pocket and carried about as pets. The entire collection is valued at between fifteen and sixteen thousand dollars. There are birds in plenty which are worth five dollars, and quite a number which will bring two hundred dollars, some even more.

G. I. Lytle is the largest exhibitor, as well as the largest breeder in the state of Minorcas, Leghorns, Plymouth Rocks and Wyandottes. He has 120 entries and his show occupies more than half of one end of the pavilion.

Burbridge & Co. have a fine show of valuable Orpingtons, white, buff, black spangle, and Diamond Jubilee, single and double combs. This company has thirty-two birds on exhibition.

W. A. Stewart has also thirty-two birds, representing Wyandottes, Partridge Cochins, Buff Orpingtons, some of which, although but a year old, weigh six and a half pounds.

George Albers has in his collection forty-four birds, all Black Minorcas. They are beautiful birds and attract a great deal of attention.

E. R. Holman, of Anaheim, has on exhibition thirteen beautiful Rhode Island Reds, which won first prize in this line, both here and at San Diego last year. The birds resemble in appearance of Buff Orpingtons.

Fred Espee has twenty-five Barred Plymouth Rocks, and they are fine. J. M. Wright of Pasadena is justly proud of his coop of twelve Black Langshans. Mrs. Fraunkhauser, of Santa Monica, makes a fine showing with nineteen Brown Leghorns. Dr. Salin, of Pasadena, is showing a choice lot of Buff Leghorns. Inglenook Poultry yard of Garvanza is represented by a full display of Blue Andalusians. H. M. McIntyre, of San Diego, has a fine showing of Buff Cochins.

W. W. Howard has a coop of White Leghorns, which he anticipates much profit from. Mrs. Cowan, of Santa Ana, has entered twenty-five Rhode Island Reds. Fred Lenz shows a large line of S. C. Brown Leghorns.

C. H. Young's coops of Silver Penciled Wyandottes attract much attention. T. Frank Anderson, who bought Mrs. A. Basley's splendid collection of White Plymouth Rocks, is represented by a fine collection of show birds.

Space, this week, will not permit a fuller of the merits of this splendid show. Suffice it to say the Plymouth Rocks have next to the largest representation, there being about 250 of all kinds. There are 300 Leghorns, 140 Minorcas, 100 Bantams, 100 Wyandottes, 50 Blue Andalusians, 25 beautiful Silver-Spangled Hamburgs, Light and Dark Brahmas, Langshans and all the other fancy breeds that scientific breeding has produced. The game chickens are well represented, for there are the beautiful Pitts, Indian, Buff Cochin and Brahmas. White Holland turkeys are the novelty, and the great Toulouse and Embden geese show that not much anti-fat is used around some poultry yards.

In the list of awards, which will appear next week, will be seen all the entries, which for lack of space are not published this week.

The display made by several poultry supply firms is very good.

Geo. R. Albers shows a complete line of incubators, brooders and poultry supplies. His improved Los Angeles incubator, with glass top, for chickens and ducks, which he has in operation hatching a lot of eggs, attracts a great deal of attention.

The West Coast Stock Food Co., of Pasadena, have a neat booth stocked with their four preparations. This is a comparatively new firm, but their Stock Food, Poultry Tonic, Lice Killer and Killamite remedies are all meeting with merited success.

W. E. Hyer and Co., of this city, show their new Sunset incubators, and also have a good display of Sharples Tubular Separators as a side line.

The Germain people show the Petaluma incubator, portable wire fence, the Church Chick Fountain, besides a full line of poultry supplies. The exhibit is in charge of Mr. Church and is very nicely gotten up. The Palmer Poultry Remedy Co. show a full line of their remedies, and away across the hall the Jubilee Incubator Co. of Oakland have a single machine on exhibition which has an interested crowd around it most of the time.

A new incubator was shown by W. B. Dean, who is a newcomer to this city. He is an old incubator builder, having been for years conected with the Des Moines Incubator Co. Mr. Dean claims his new machine, the "Pacific," to combine the best points of others he has built, it being stormproof. He will shortly open downtown quarters and push the sale of his machine.

HIS EYE WAS SOT.

"That reminds me of the old darkey whose mule suddenly died," said Secretary Hay, when questioned regarding the suggestion from France that the status quo on the Isthmus of Panama be restored in order that Colombia might ratify a canal treaty.

"The mule fell dead on the street and a number of men gathered around. One of them asked the darkey if he could be of any assistance to him in seeking to save the animal's life.

"'No, boss,' replied the negro, "it am no use to try now. The mule's eye am sot."

JUBILEE INCUBATORS

The "Business" Machines of the World
Use the Jubilee—There is every reason why you should and no reason why you should not.
We make them in sizes from 60-eggs to 1056-eggs capacity—Every one perfect. If you are interested in poultry for profit send for the Jubilee Catalogue No. 30.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE, CAL.

ORNAMENTATION OF STREETS AND HIGHWAYS.

In the ornamentation of streets and highways, by far the most important consideration, is the alignment of these thoroughfares, upon a broad and generous plan, with suitable shade trees, properly planted. It is, then, to this phase of the subject that I shall confine my remarks and as the keynote to success is co-operation, these remarks will apply more particularly to cities, towns, and the more thickly settled rural districts, though the argument will apply with equal force to the individual owner.

* * *

VALUE OF SHADE TREES.

Before entering upon a discussion of the ways and means to accomplish the best results, it is eminently proper that good and sufficient reasons be given for such planting; or, in other words, of what value are shade trees to a community?

There are at least four good reasons why we plant: 1st. For Ornament. 2nd. For Health. 3rd. For Comfort. 4th. For Protection. No particular specification is needed regarding the increased and increasing value of property, for this must necessarily be demonstrated in the consideration of the four points noted.

1st. Ornamentation.—That street trees are ornamental and that ornamentation pays in many ways, no one will deny, but it pays in dollars and cents. Beautifying a neighborhood is not a mere fad; it costs but little more to make it attractive than to leave it or to make it unsightly, and a well kept, well planted district will not only attract, but command residents desirable in every way; certainly those who are educated and refined. It is not mere sentiment that prompts the railroads to advertise the attractions along their lines; beauty to them represents cash. If people choose a line of travel because of its natural and acquired beauties, how much more eagerly will they seek such a place for a residence. Landscape beauty is capital. Again: not one of us would be satisfied to spend his days (or even nights) in a desert, though surrounded with the necessities of life in plenty. Our natures crave something better, and we ofttimes travel far seeking the most beautiful location obtainable.

* * *

2nd. Health.—Trees add greatly to the healthfulness of populous districts by cooling and purifying the air, the foliage evaporates large quantities of water from its surface and the reduction of temperature in this way is greatest during the driest and hottest weather. The foliage also absorbs impure and therefore harmful gases. Trees also promote circulation of air (due principally to unequal temperature).

* * *

3rd. Comfort.—Trees add materially to comfort, either in city or country, not alone to shade the passer-by, and the idler who rests beneath their branches, but in a climate like ours, with perpetual sunshine, they soften the glare and heat of the sun on sidewalks. They also permit many to sit out in the free air to read, even to eat and to sleep, thereby contributing not alone to comfort, but to health.

* * *

4th. Protection.—Everyone present will concede that street trees afford protection from both wind and sun, but as a protection against fire they are not so well known.

D. F. Sullivan, Chief of the San Francisco Fire Department, writes that shade trees on sidewalks are beneficial in checking the spread of fire. First, they are good as windbreaks, keeping sparks and cinders from nearby buildings. Second, they shield the houses, preventing them from catching fire from the heat. He tells of a recent fire in a stable where a single large tree prevented the destruction of a three-story flat adjoining. In this case there was considerable delay in getting water, so that it gained great headway.

Now we come to the most important point, that of obtaining uniform planting, or one kind of tree for each street. Most communities are planted with several sorts of trees to each block, of every conceivable size, color, form, and degree of desirability. Such planting looks as irrational as an orchard of all sorts of fruit trees hopelessly mixed; oranges, peaches, walnuts, persimmons, olives and pomegranates—no order, looking much as though the different seeds had been scattered by hand, except they are planted in rows. Prof. Waugh, in his work on landscape gardening, says such street planting reminds him of nine monstrously different buttons in a row down the front of a Prince Albert coat.

Wm. S. Lyon, in his "Gardening in California," says: "There is one feature in the planting of street trees that calls for special mention. This is the reprehensive practice of planting a jumble of sorts upon the same block. Not only is the effect as a whole bad, but the individual beauty of each is lost in the kaleidoscopic shifting of

(Continued on Page 476.)

Deciduous Trees — Citrus Trees — Ornamental Trees

FOR SEASON 1903-04

Our stock of all varieties of trees is large. Year by year we have tried to anticipate a large and growing business, and this season we feel confident that planters will find our stock unusually complete and far above the average in grade and appearance.

Winter Bartlett Pears

Have you heard about them? Of all pears of recent introduction, this pear takes the lead. It does not ripen until November, and will keep two months after picking. We have a good stock but orders should be booked early.

Plums

Plums ought to be more extensively planted. Pitted dried plums are always a scarce article on the market and the demands exceeds the supply.

Burbank's Sugar Prune

This is a great leader. The fruit is larger, sweeter, and ripens fully three weeks earlier than the French prune. No danger of having your fruit damaged by rains when drying if you plant the Sugar Prune.

Apricots

Apricots sold well this year. California has a strong hold on cots, being the only state in the union producing them. We grow all the standard varieties—Blenheim, Royal, Routier Peach. The Tilton, a new introduction, and highly esteemed in Kings county, is worthy of trial.

Peaches

The canners want more clings, couldn't get enough this year of Tuscan, Phillips, Orange and McDevitts. You can make no mistake in planting clings if there is a cannery in your vicinity.

The triumph is one of the best early peaches grown, much larger than Yellow St. John, and two weeks earlier. A great shipping peach.

Canners never get enough Foster peaches. They can well, have a fine color, and most delicious flavor. Better look into their merits.

The Elberta, Muir, Wheatland and Lovell peaches are old standbys for canning, drying and shipping. Our buds are taken from bearing trees. You take no chances when you buy from us.

Cherries

Cherries are in great demand now. Fruit on the trees sold for from four to five cents per pound this season. Many coast counties are wonderfully well adapted for cnerries.

Calimyrna Fig Trees

The Genuine Smyrna Fig of Commerce

To give this fig the distinction it deserves, and at the same time to honor California, the state in which it was produced, we have named it "Calimyrna," a combination of the two words California and Smyrna.

Think for a moment what the Washington navel orange has meant to the great fruit industry of California and you will get some idea of the importance that should be attached to the Calimyrna Fig, which was originated by Mr. Roeding.

When a man originates a good thing, there are always imitators who claim to have something just as good. This is true in the tree business. The only difference is you cannot eat fig trees and tell what they are, neither can you decide with the closest scrutiny whether what you are buying is as represented. When you buy trees bear in mind that it is not like buying groceries or hardware—you must wait three years before you know your fate.

Remember we have the only genuine Calimyrna orchard in bearing in the United States. When you buy Calimyrna Fig Trees you want to be sure you are getting the genuine article. You know that trees, the identity of which is doubtful, are expensive at any price.

The first cost of a tree is a minor matter—it is the time, money and labor that you put into your orchard after it is planted that counts.

You may satisfy yourself as to the merits of these Calimyrna dried figs by sending to us for a sample box, which is sent to any address post paid on receipt of 20 cents.

In order to protect the planter as well as ourselves we have devised a seal, so you will find all our Calimyrna Fig Trees this season branded

Calimyrna
R
Fresno

None genuine without this seal.

The book entitled, "The Smyrna Fig at Home and Abroad," by Geo. C. Roeding, is full of valuable information and will be found very interesting and helpful to those who are thinking of planting figs or who are in doubt as to what to plant for a profitable crop. Price 25 cents post paid.

Send For Our Large Illustrated General Tree Catalogue, Postpaid, 5c.

Until you have seen our catalogue you do not realize what a helpful book a catalogue is to tree planters. We have been told a good many times that this is the most complete catalogue in many ways that has ever been printed in the West. It is unlike any other in that it is more carefully compiled, lists more trees, is easier to consult, and contains more practical information. We shall be pleased to answer any questions of intending planters.

The San Diego Institute...

The San Diego Farmers' Institute has passed into history as one of the most successful meetings held in Southern California this year. The attendance was large and the interest unabated from the first session to the closing banquet. The programme included addresses and papers by many of the most distinguished authorities, on the subjects discussed, in this part of the state.

Judge Haines opened the convention with an address of welcome, the central point of which was the importance and the dignity of the work of the Farmers' Institutes. His discussion of the relative merits of organized labor and organized capital was an earnest plea for unified efforts and action on the part of the farmers of this land.

"Associated capital and organized labor," said he, "have their fields of activity in the cities and in the mining and manufacturing centers. These combinations are the offspring of civilization, therefore, inevitable, and on the whole, beneficient. Even their struggles with each other have, as I venture to think, their proper place in the large economy of modern society.

"What then is there for the scattered and unorganized agricultural population? Is it helpless and to be perpetually ground between the upper and nether economic millstones? By no manner of means. It has the soil to fall back upon. Between the contending and, at the same time, leagued forces of associated capital and organized labor, the great masses of people who live by tilling the soil in this wide extending country hold, after all, the balance of power; they form the great bulk of consumers; they are, in large measure, the final employers both of the works of the capitalist and the labor of the operative: 'It is the farmers,' says Secretary Wilson, 'who have paid the foreign bond holders;' and they have, aside from political action, in which also they have their potency, one unfailing resource against undue exactions, whether by associated capital or organized labor, or both."

* * *

The Olive.—Dr. W. W. Sherman, of Fresno, is credited with presenting one of the most interesting papers of the convention on the olive. His discussion embraced its varieties, care and use. He said in part:

"During the past fifteen years many olive trees have been planted without any consideration, as to variety and soil. The real causes of failure and discouragement can be traced to three reasons, namely: improper selection of variety and soils, lack of tillage and irrigation, commercial conditions. Much the same thing obtains with the olive as with the resistant vine, in order to be successful we must choose a tree suited to the soil in which it is to be planted. We should be acquainted with local climatic conditions, and before planting our trees we should know whether the conditions of soil and climate is favorable to the olive and what particular variety it is most favorable to. The tree should be selected with care. This is the next consideration to that of soil and climate. The lack of success in the past and the fact that so many planted, only to fail, and pull up their trees a few years afterward, should prove a valuable warning to others who may follow.

Proceeding to the consideration of varieties, which is most important, and where in so many groves have met failure, Dr. Sherman said.

"From the seventy varieties of olives, about ten are mostly represented in the orchards of this state, these are, after careful trial and observation reduced to three favorites, namely, the Mission, the Nevadillo Blanco and the Manzanillo. The Mission seems to be the first choice, probably because it was first introduced and has stood the test of time. It embraces several sub-varieties, the most common, however, is the broad-leafed form, but all are of the same type, varying somewhat in size only. In the olive growing sections from Chico to San Diego, this variety runs about 100-101-106 to the pound, those grown in Southern California being a little the largest.

"The Mission is said to grow smallest in the bay regions, being 145 to the pound. It is said that the largest Missions grown in Southern California contain the least pit waste, the average being 15 per cent, the next in order being those from the San Joaquin valley with 16.4 per cent, the coast range 16.8 per cent and Northern California 17 per cent. The foothills fruit runs 19.2 per cent against 20.8 per cent in the bay regions fruit. This is interesting as evidence of soil effects, and in time will no doubt be brought to a scientific and reliable statement, and used as a guide in the selection of varieties suited best to the various soils and localities."

Pruning, irrigation and picking were also gone into exhaustively. Pruning should be done annually, regularly and systematically, so as to give the tree the benefit of symmetry and new growth. A moderate amount of water must be used, but not to excess, for the olive is sensitive to too much water.

The crop should be gathered before danger of frost, and but little attention paid to the color of the fruit on the trees. An olive may be ripe while its color is quite green, and with us the dark color does not seem to develop until the nights get quite cool. When we can pick the olive from the tree and squeeze the pit out with our fingers, then it may be picked whether for oil or for pickling. It is best for oil when gathered early or before it has fully matured and colored. The green and black fruit is all treated alike when used for making oil, but if for pickling they are hand graded for color, the green, red and black, being separated and processed each to itself.

* * *

Mrs. M. E. Sherman's topic was "Raisin Grapes and Raisers." Her effort was well received and produced a pleasing effect on her auditors. She brought out the many sides of growing, protecting and marketing the fruit which were suggestive of improved methods in handling raisins. Mr. Culbertson followed with a discussion in which he commended the industry as the most profitable of any, since the Raisin Growers' Association had been formed. Green manuring for the production of extra humus, and chain pruning for the prevention of colure or dropping, and the proper selection of cuttings, were some of the points touched upon.

Another interesting paper was that read by Mrs. Carrie Williams, on silk culture in California, showing that much unused labor could be profitably applied to raising silk worms, eggs and cocoons. "Why should we send out $50,000,000 for a product that can be turned out on our own soil? Should reeled silk, which is really a manufactured article, be admitted free of duty to increase the profits of the silk trust?"

F. Austin read an interesting paper on the results of the work of Scuttellista in San Diego county. This paper emphasized the good work this insect is doing on red and black scale. But as this subject has been so generally discussed in the Cultivator, it is not necessary to go into extensive detail at this time.

Dr. Reed of Riverside read a paper on "New Departure in Citrus Culture," which was well received.

Mr. Ernest Braunton discussed "Street Ornamentation," and urged the planting of one kind of tree for each street. His paper appears this week.

"Fighting Scale Insects and Red Spider," was the topic of a very elaborate article on spraying and fumigating from a practical standpoint, by C. A. Day, of Pasadena.

C. C. Teague, of Santa Paula, made an address on the tent system of curing lemons, which has revolutionized the method of handling lemons.

Frederick Kahles, of Montecito, a recognized authority on spraying, made a highly interesting talk.

Dwight Griswold, of Tropico, presented a paper on Strawberry Culture, which will appear in the Cultivator soon.

One of the papers anxiously looked for, because of the high character of the gentleman who was to read it, was the one on experiment stations, by Prof. J. W. Mills. Prof. Mills was called away from the meeting, much to the regret of the convention. President Gates, of Pomona, made a strong address, "Keeping the Boys at Home." The exercises closed with a banquet, which was a pleasant affair. In closing this report it is only just to the people of San Diego to say that the success of the Institute was in the main due to the committee having it in charge.

The following committees were appointed: Resolutions, J. W. Mills, Ontario; C. C. Teague, Santa Paula; R. C. Allen, Bonita. Farmers' Clubs and Seaside Institutes, H. Culbertson, El Cajon; F. Kahles, Santa Barbara; D. Griswold, Tropico. Plans for the Year, H. Copeland, Chula Vista; F. Austin, Escondido; E. N. Reed, Ioamosa; C. C. Chapman, Fullerton; J. Wasson, Pomona.

COMING HOME AT NIGHT.

When the shades of night are falling
And the shadows gather fast,
I cease me from my labor,
For the day is done and past.

And I hie me from the city,
With its dust and heat and noise,
To my home beside the ocean,
And my wife and baby boys.

My troubles oft are many,
But they quickly fade away
When I reach my little cottage
At the closing of the day.

I hear the little footsteps
That come pattering o'er the floor,
And the little hands that try to reach
The knob upon the door.

In my arms I quickly gather
My bonny little men;
Glad to welcome home their father
When he comes from work again.

While their mother smiles a greeting
From the kitchen warm and bright;
My home is like a heaven
When I get me back at night.

Loving faces all around me
And the fire is burning bright;
Oh, my cottage is a castle
With the coming of the night.
—Duncan L. Smith.

THE BUCCANEER.

The term "buccaneer" is assocated in most people's minds with that of "pirate." The buccaneers were at first privateers authorized to prey on Spanish commerce, but afterward degenerated into sea robbers. On one of these buccaneer ships more than a century ago among the crew was a woman dressed in man's clothes. She had worn this attire for several years as a soldier and taken part in a number of battles. When peace came she concluded to try the sea, and, shipping for the West Indies, joined the buccaneers. The secret of her sex was well preserved and not a person knew that she was a woman.

Anne Prestwich or Peter Prestwich as she was known on the buccaneer, fell desperately in love with one of the sailors, Percival Whitford, a large, blue eyed, flaxen haired, devil may care fellow, who, though he treated Anne in as friendly a manner as any one else, not knowing that she was a woman, had no thought of the tender passion.

Anne concealed her love, not daring to reveal it with a confession of her sex for fear that Percy would be repelled by the knowledge. For months she worshipped him in secret. Then an opportunity arose for revealing her love under the most favorable circumstances. Percy became involved in a quarrel with a sailor named Millican, and a challenge passed. Whitford and Milliken were in different watches, and the duel could not take place until after eight bells in the afternoon. Shortly after dinner a number of the crew were lolling on the forecastle, among them Anne Prestwich and Millikin.

"You'll make short work of the blue eyed fellow," remarked one of the men to Millikin.

"If he does," said Anne, "it'll be by foul means."

"What!" cried Millikin, starting up, while the others looked thunderstruck.

"Didn't you hear me?" replied Anne. "Coward don't fight fair. They always manage to get some advantage."

"You dare say this to me!" shouted Millikin, standing on his feet and putting his hand to his knife.

"I say nothing except what's true."

Millikin made a rush for Anne, but those present stood between.

"I'll have your life for this!" cried Millikin. "As soon as I get through with Withford I'll attend to you."

"Why wait for that?" asked Anne coolly. "This is as good a time as any, and you'll have to wait until eight bells for Whitford."

"Agreed. I'll fight you now. Draw!"

"I have choice of weapons, and I chose swords," said Anne.

A ring was formed, a couple of ordinary swords were brought up from below, and the two opponents set to work. Anne, the ex-soldier, who had been drilled in sword exercise in barracks, from the first showed her superiority to Millikin, whose only action had been in action with the cutlass. She received a few scratches, which her opponent intended for mortal wounds, and, watching her opportunity, ran him through the heart. Millikin dropped dead, and Anne, wiping her sword on her trousers, turned and went down the companionway.

When Whitford came off watch he had been told that there was no quarrel on his hands since Peter Prestwich had removed his antagonist. He went straight to Anne, whom he found in the forecastle.

"Pete," he said, "what do you mean by taking my quarrel?"

"I had as good a right to fight him as you."

"But they say you insulted him without cause. Then you proceeded to fight him before I had my turn with him."

"Yes; that's true."

"Well, it's plain that you stepped in between him and me. Millikin never injured you. Tell me why you have interfered to shield me."

Anne turned away, but there was something in the glance she gave him that sent a thrill through him, though he did not know why.

The next day the buccaneer touched port at one of the coast towns, and when the first batch of short leaves were granted it happened that Peter Prestwich and Percy Whitford were among the number who went ashore. When they reached the quay Anne went off by herself, while the others sought the nearest saloon. Later they drifted into the San Luis tavern, and while they were standing at the bar a waiter stepped up to Percy Whitford and whispered that a lady wished to see him in a parlor upstairs. Not aware that he knew any woman in the place, he hesitated a moment, then without speaking of his going, sauntered out.

When he entered the room there was but one woman in it. A trim figure stood before the window robed in a plain but neat gown, cut in the fashion of the times, while on the head was a cap, which entirely concealed the black hair. Percy advanced, and as he did so, the woman turned, but while his face was in the full light of the window hers was not. There was something there familiar in the rather attractive face. Percy was sure he knew the girl, but could not place her.

"Lassie," he said, "you've got the better of me. What? Pete Prestwich in woman's clothes?"

He started back. Something came rushing over him like the moving of a great flood.

"Not a man; a woman," said Anne, looking down at the floor.

The revelation to Percy that a woman had stood between him and an even chance between life and death resulted in a complete conquest. They left the buccaneer service, married and lived the life of planters.—Ex.

HOW TO PRESS SLEEVES.

In pressing sleeves, which is the bane of the ameteur's life, keep a wooden rolling pin for that purpose alone. Insert in the sleeves, and the pressing of seams and wrists also is as easily done as though it were a flat surface. Cover pin with flannel. Keep a heavy piece of flannel to lay over the ironing board when pressing wool goods. This prevents the shiny spots so objectionable in a finished garment.

PEOPLE WHO FORGET.

A few forenoons ago a perspiring red-faced man, at the head of a prespiring, red-faced, fat family, consisting of a wife and four little girls with amazingly starchy skirts and with pigtails pulled so taut that they didn't appear to be able to wink their eyes, started through a gate at the Baltimore & Ohio station leading to an accommodation train that was about to leave for Maryland way stations, says the Washington Star.

"Tickets," said the gateman, unenthusiatically, as the fat father of the fat family started to hurl himself through the gate.

"Huh?" said the father of the family, a half sheepish, half chopfallen expression crossing his dripping countenance.

"Tickets," repeated the gateman, yawning dismally.

"B'jing," exclaimed the fat man, dismally, "I forgot the tickets. Clean forgot to buy 'em. Say, can't you let us through and I'll pay the conductor in cash for our rides—hey?"

"Don't block the line, please. Have your tickets ready!"

The fat man squirmed back out of the line, encountering as he did so the collective glares of the pushing people behind him, and the much more intensified glare of his wife.

"Forgot to get the tickets, Rosanna," said the fat man, looking foolish, to his spouse. "Get 'em in half a second, though—be right back. Wait right here with the children."

And he dashed through the swinging doors at a lumbering waddle, while his wife dropped all of the hand baggage with a thump and the four highly starched little girls picked out grips and suit cases upon which to squat until their parent returned with the tickets.

He returned to his family in about four minutes, holding the tickets in his left hand, and agonizedly mopped his face with the handkerchief in his right. His fat face was contracted into an expression of acute misery.

"My dear girl," he said, edging apologetically alongside his wife, "it's a mighty good thing I stopped to take a glass of water at the cooler inside just now—a mighty good thing, indeed."

"Well, what is it now?" she asked him, in a tone filled with the prophecy of trouble.

"Now, don't be annoyed, my dear Rosanna," said the fat man, more miserable than ever, "but I fear that we shall be slightly delayed—but only until the next train, you know. There's another one going in only two hours and forty-five minutes, and I'll be back long before that."

"Back from where?" she asked him, acridly.

"Now, please, I beg of you, do not make things worse than they are by an exhibition of temper, by dear Rosanna," moaned the fat man, hopelessly, "but my taking that drink of water at the cooler inside just now reminded me that I left the cold water turned on in the kitchen sink when I left the house. Just you wait with the children in the waiting room—I'll buy you some papers and magazines—and—lets' see—I can get out to Tenleytown and back in an hour and a half, say, and that'll give me plenty of time for the next train. I couldn't be comfortable, you know, away for two weeks with that cold water running full blast. The durned sink might overflow and it 'ud cost me all the money I could make for the next ten years to pay for the damage. Now, don't worry," and the fat man darted out of the station at a waddling lope, while the wife of his bosom gathered up the traps once more and led the way to the waiting room, the four little starched girls trooping gloomily after her.

"Notice that?" said the gateman, dismally, slamming the gate leading to the accommodation train after the last belated passenger had cantered through.

"That's the way they're drifting along all the time—the forgetters, I call 'em. Another one of 'em just like that fat old party came catapaulting toward this gate only an hour or so ago, with his wife all but hanging onto his ccattails. He was racing for the gate at such a clip that she could parely keep up with him without maintaining a strong clutch on his apparel. I picked him out instantly as one of the forgetters, and when he handed me his tickets to punch I noticed that his tickets didn't have the 'B' baggage punch mark in them.

"'You've checked your baggage, sir, I suppose?' said I—knowing, of course, that he hadn't.

"'Why, no, I havn't!" he sung out, giving his thigh a whack. 'Say, it's a good thing you reminded me of that.'

"'Did you wait at the house for the transfer man to call for the baggage. James?' his panting little wife inquired of him in a tone of suspense.

"'Well, no, I did not!' he exclaim-

If you have any trouble with lamps—any trouble whatever—send for my Index.

I know of no lamp-disease that it does not cure immediately.

Costs nothing.

ed again. 'Was that the arrangment? I thought you'd attend to all that.'

"'Now, don't you remember,' she plaintively said to him, 'that when I came down town ahead of you to do that little shopping that I had to do, and left you to close up the house, the last thing I said to you was: "Now, James, be sure to wait here until the transfer man comes for the trunks—he promised to be at the flat at 10 o'clock, prompt—don't you remember that that was the very last thing that I said to you, James?'

"'No, I don't remember any such a thing," James brazened it out. 'I thought you'd at least have the consideration to attend to the trunks, instead of hiking downtown to get a dinky little veil, when you've got eleven million veils already—and here we are with the train due to start in four minutes, and there are our trunks locked up in the bedroom of a house forty-five minutes' ride away on the fiery, untamed underground and overhead trolley cars—oh, it's all off, that's what it is—there's no use in talking about it at all, it's all off!' and he galloped toward the exit, with his tired-looking little wife hanging onto one of his arms with both hands and being jolted over the boards and up the steps like a rag doll in the hands of a pickaninny. They havn't got back yet, and I guess by this time James is hurling the things out of the trunks and jawingly announcing that the trip is still all off and that it's going to remain all off."

RECIPES

Eat Little, but Have That Little Good

Evening Lunch—A delightful lunch can be served at night with oyster patties, bread and butter, and chicken salid, sherbet, cake, coffee and nuts.

Macaroons—Half a pound of almonds, blanched, dried and pounded to a paste, with one teaspoonful of rose water. Beat together with whites of three eggs and half a cupful of powdered sugar, adding the sugar by the teaspoonful. Add half a teaspoonful of almond essence, then add the pounded almonds, and, if too soft to be shaped, add a teaspoonful of flour. Roll with wet hands into balls the size of walnuts, flatten them slightly, place some distance apart on buttered paper and bake slowly.

Iced Fruits—Dip sections of oranges or selected whole small fruit, such as cherries, in the slightly beaten white of egg, roll in fine granulated sugar. Dry and serve very cold. If oranges are used divide carefully and remove the tough membrane and seeds.

LAUNDRY HINTS.

By most housewives the ironing of table-linen is a much-dreaded task, but by using the following plan it may become a real pleasure: We all realize how easily linen is drawn out of shape when wet, and how hard it is to regain if dried in that condition. All this trouble and exertion of pulling and stretching may be avoided, if when the table-cloths are being hung upon the line the selvages are folded evenly together and pinned to the line, corners first, then the sag. The edges must be stretched gently in place, and held with pins not more than twelve or fifteen inches apart. If pins and line are scarce, the napkins may be hung over the table-cloth, allowing the same service for both. Shake out all unnecessary folds and wrinkles that may remain. When possible, leave out until dampened by dew; if not, sprinkle, and fold in the usual manner. Let lay at least an hour or so, then shake out, and iron single. Begin at a corner. Iron lengthways, then across, keeping the linen squared. This is the secret of success. Turpentine in the starch produces gloss.—December Woman's Home Companion.

ORNAMENTATION OF STREETS.

(Continued from page 47.)

form and color, that only serves to confuse and bewilder the passerby."

Little can be done toward uniform planting without zealous and well directed co-operation on the part of all interested. There must be unity and intelligence of plan, and the work should be carried on by those necessary organizations which "do not presume to tell the community how it should spend its money, but only how to get, with efficiency, the greatest amount of sightliness for its money." It is of the highest importance that a plan be outlined on which people of diverse tastes and interests can either agree or effect a compromise. It will not be impossible to find a tree upon which all will agree, for the vast majority of people desire above all things that their neighborhood should be attractive and will yield somewhat in their opinion in order to obtain desirable results. We must learn to sacrifice some things in order to get others of different tastes to co-operate with us. It is best, perhaps, after a thorough discussion of the merits of the different trees, to put the selection of one for each street to a vote and let the majority rule, not forgetting that this is a matter which concerns the general public more than the individual.

* * *

PREPARATION.

One of the greatest mistakes made is the lack of preparation. All holes for trees, no matter in what soil or what the size of the tree, should be dug from three to four feet deep and of the same diameter. Fill this hole with the best soil to be had, putting the very best at the bottom, below the roots. The tree, finding better food below than above, will develop a deep root system and you will not then find so many dying trees nor so many heaved and broken sidewalks.

In choosing your stock get free-rooted and vigorous trees, not stunted ones. Better plant a thrifty one six inches high, than one as many feet whose roots have been confined for two or three years in a pot or can.

* * *

WHAT TO PLANT.

As a rule, too many trees to each lot are planted. Three trees on a fifty-foot lot are plenty, and the center one should be taken out after a few years. The points to be considered in the choice of a tree are about six in number, as follows: (1) General appearance, (2) Drought resistance, (3) Cleanliness, (4) Amount of care, (5) Rapidity of growth, (6) Root system.

In some places it is desirable to have deciduous trees, and the argument in their favor consists of the fact that they allow a maximum of sunshine in winter and give a maximum of shade during the summer. But in California we can always get plenty of sunshine, and unless the location is such that too much mud or dampness will be produced, I prefer evergreens.

When all nature is gay and everyone has cause to rejoice; when the hills and vales are covered with wild flowers and the air is laden with perfume from the orange groves; while the palm and banana are unfolding their wondrous leaf growths, we are rudely awakened from our pleasant contemplation of the beauties of nature by the sight of the cheerless leafless deciduous tree, forbidding, inhospitable, the very picture of desolation, totally at variance with the beauty everywhere expanding.

On a warm, sunny day in winter, when we look forth on waving fields of grain, or citrus groves weighed down with fruit, a leafless tree looks to me nearly as much out of place as a banana grove in Minnesota or the Dakotas.

The word evergreen is not meant to cover conifers or bearing trees alone, as the word is used in the east, but just what Webster says it means; any tree which retains its leaves throughout the year. Conifers, by the way, are unfitted for roadside planting except on avenues of unusual width, where 20 to 30 feet may be allowed for them, either along each side or through the center. Allow me again to quote from "Gardening in California." The author says: "Conifers are frequently used for street planting, but as language is not strong enough to condemn the impropriety of their use for this purpose no further attention is accorded them here."

"Public convenience demands the removal of all lower branches for a height of eight or ten feet of trees that align a sidewalk or public highway. As the exquisite beauty of most conifers depends entirely upon the integrity of the lower limbs, the impropriety of planting any tree subject to these requirements becomes apparent."

The same may be said of all cone bearers and many others upon private premises. Trees of pyramidal growth should be allowed the whole of their natural support.

GO TO GARDENA

Where the alfalfa grows so luxuriantly, giving from 6 to 8 cuttings per year, and producing when fed to cows a superior product of milk and butter—the secret — there being no alkali to detract from the purity of the milk, as demonstrated by the noted Strawberry Brand of Butter made by Mr. Davis of Gardena. The success of our Chicken Ranches depends upon having green alfalfa as a food product in the production of eggs at a time of the year when the dry ranch farmer has no green feed to make the hens lay. Our small alfalfa, dairy and chicken ranches are making good livings.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 16 ACRES, $7,700.

A profitable farm with 6-room house, 2 large barns, chicken houses and corrals. Good bearing apple orchard, interset with Loganberries; 9 acres set out in young walnuts; ½ acre peaches; ½ acre raspberries; ½ acre strawberries; 1 acre rhubarb; 1 acre young vineyard; 2½ acres in alfalfa, and 3 acres to be seeded to alfalfa.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, seeas, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 29 ACRES, $12,000.

One-half mile frow two electric car lines Seven-room honse, barn, corrals, pasture, 17 acres alfalfa, 4 acres of strawberries, family orchard (all fenced) with a good pumping plant.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house snd barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

San Francisco Markets.

Dairy.

San Francisco, Dec. 9, 1903.

The general tone of the market has been easy for the past few days.

BUTTER—Per lb:

Creamery, extras	28	@29
Creamery, good to fancy	25	@27
Dairy, extras,	23	@24
Dairy, choice	21	@22
Store	18	@20
California, storage	24	@27
Eastern Creamery	23	@25

Eggs and Poultry.

The market on eggs is also somewhat sluggish.

EGGS—Per doz:

Ranch, selected large	52	@52½
Ranch, good to choice	45	@50
Store	Nominal	
California storage	28	@32½
Eastern	25	@30

Cheese is quiet at former prices.

Sharp depreciations in prices for poultry and game were effective today as a result of the closing of the restaurants and eating houses and the respective markets ruled decidedly easy, with a strong downward tendency apparent.

POULTRY—Old roosters, per doz., $4.50@5; young roosters, $4.50@5.50; fryers, $4.50@5; broilers, large, $4.@4.50; small, $3@4; hens, small, $4.50@5; large, $5@6; ducks, per doz., old, $5@6; young, $6@7; live turkeys, per lb., 20@23c; dressed turkeys, per lb., 25@27c, geese, per pair, $1.75@2; goslings, $2@2.25; pigeons, per doz., old, $1@1.25; squabs, $2@$2.25.

Fruits and Vegetables.

The effect of the closing of many of the leading restaurants was most keenly felt in yesterday's business in most kinds of fruits, and the market as a whole was one of marked easiness, with values more or less nominal.

DECIDUOUS FRUITS—Apples, per box, common, 40@65c; choice to fancy, 75@$1; extras, $1.25@1.50; Spitzenbergs, $1.75@2; Lady apples, $1.25@2.

Pears—Per box, Winter Nellis, $1.50@2.

Pomegranates—Per box, $1.25@1.50.

Persimmons—Per box, 50c@$1.

Quinces—Per box, nominal.

Table Grapes—Per small box, 40@60; crate, 60@85c; large box, $1@1.50.

BERRIES—Per chest; Strawberries, Longworth, $8@12; large varieties, $3@4, as to quality; raspberries, $5@7; cranberries, per bbl., Eastern, $11@12; Oregon, per box, $2.50@$3.50.

CITRUS FRUITS—Per box: Oranges, new crop navels, $1.50@2.50; seedlings, 75c@$1.50, Late Valencias, nominal; lemons, $1@2.50; extra, $3; grape fruit, $1.50@2.50; tangerines, $1@1.50; Japanese Mandarins, $1.25@1.75; limes, $4.@4.50.

The potato market is dull and trading tame.

VEGETABLES—Tomatoes, per box, 40@65c; do, southern, per crate, 50@65c; green peppers, per box, $1@1.25; string beans, southern, per lb., 2@4c; wax, 2@4c; Lima, per lb., ——, green peas, southern, per lb., 3@5c; egg plant, southern, per lb., 10@12½c; southern summer squash, per box, 40@65c; cucumbers, per box, 75@85c; mushrooms, per lb., 10@25c; garlic, per lb., 6@8c; dry ogra, per lb., 12½c; marrowfat and Hubbard squash, jobbing at ½@¾c per lb.

ONIONS—Yellow, per ctl., $1@1.20.

POTATOES—Per ctl.: River Burbanks, 75c@85c.; Early Rose, nominal; River Reds, 60@75c; Salinas Burbanks, $1.25@1.50; Oregon Burbanks, 85c@$1.10; sweet potatoes, $1@$1.15.

Dried Fruits, Nuts, Etc.

Spot trading in all lines of Dried Fruits is very slow and confined principally to small jobbing wants from local consuming channels.

DRIED FRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 4½@6c; Sun Dried, 3¼@4c.

Apricots—Royal, fancy, 9@10c, choice, 7½c@8½c; Moorparks, choice, 9½@12c.

Peaches—Choice, 5¼@6c; fancy, 6¼@7c; peeled, in bxs, 11@14c.

Pears—Choice, 7½@8½c; fancy, 9c.

Plums—Pitted, 6¾9c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 2¾@3c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5½c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1903 crop, f. o. b. at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.35; Two-Crown London Layers, $1.25; Muscatels, Four-Crown Standard, loose, 6½c per lb; do, Three-Crown, 5⅝c; do, Two-Crown, 5¼c; Seedless Muscatels, 4¼c; Seedless Muscatels, floated, 4½c; Seedless Standard Sultanas, 4¼c; Thompson Seedless, Standard Sultanas, lencias, Standards, 4¼c; do, Pacifics, 3⅝c; Orientals, 2¾c; Malagas, Three-Crown, 5⅝c; do, Two-Crown, 5c.

BARLEY—Choice No. 1 feed, $1.11¼@$1.15; off grades, $107½@108¾; brewing, No. 1, $1.17½@$1.22¼; Chevalier, $1.30@1.45.

CRACKED CORN—Choice quality, per ton, $29@$30.

OATS—Good to choice white, $1.22@1.35.

Hops.

The price for new crop is 18@22c per lb., according to quality.

WOOL.

Fall clip, per lb: California Plains, 6@8c; Foothills, 8@10c; Middle Country, 10c@12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

Chicago, Dec. 9.

A bullish tendency pervaded the market today, occasioned by reports which come in lowering the percent of the wheat crop somewhat in the wheat producing sections of the country.

Cash quotations were as follows: Flour was firm; No. 3 spring wheat, 82; No. 2 red, 83½@86⅝; No. 2 corn, 41½; No. 2 yellow, 44; No. 2 oats, 34¼@38; No. 3 white, 35@37; No. 2 rye, 50½@51; good feeding barley, 36@37; fair to choice malting, 48@58; No. 1 flax seed, 91; No. 1 northwestern, 98; prime timothy seed, 2.85; mess pork, per bbl., 11.25@11.37½; lard, per 100 lbs., 6.37½@6.40; short ribs, sides (loose,) 6.00@6.25; short clear sides (boxed,) 6.12@6.25; whiskey, basis of high wines, 1.27; clover, contract grade, 11.00.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	56,600	28,200
Wheat, bushels	195,900	52,300
Corn, bushels	248,700	51,500
Oats, bushels	422,000	78,900
Rye, bushels	14,200	8,800
Barley, bushels	187,700	22,200

On the Produce Exchange today the butter market was steady; creamery, 16@25; dairy, 14@17; eggs, firm at mark, cases included, 24@26½; cheese, steady, 10@10½.

Chicago Live Stock.

CHICAGO, Dec. 2—Cattle—Receipts, 2500; slow; good to prime steers, 5.25@5.75; poor to medium, 3.50@4.90; stockers and feeders, 2.00@4.10; cows, 1.50@4.00; heifers, 2.00@4.75; canners,1.50@2.40; bulls, 2.00@4.30; calves, 2.50@6.50; Texas fed steers, 3.00@4.00; western steers, 3.00@4.50. Hogs—Receipts, today, 45,000; tomorrow, 35,000; steady; mixed and butchers, 4.25@4.60; good to choice heavy, 4.45@4.60; rough heavy, 4.25@4.40; bulk of sales, 4.35@4.45. Sheep—Receipts, 25,000; sheep and lambs steady; good to choice wethers, 3.75@4.25; fair to choice mixed, 3.00@3.75; western sheep, 3.00@4.50; native lambs, 3.50@5.80; western lambs, $3.80@4.65.

California Dried Fruits.

NEW YORK, Dec. 9.—The market for evaporated apples is attracting little better demand, and the undertone is a shade firmer; common, 4@4¾; prime, 5@5½; choice, 5¾@6¼; fancy, 6¾@7. Prunes steady at 2½@6½ for all grades. Apricots rule steady at 9@9½ for choice; 9¾@10¼ for extra choice, and 14@15c for fancy. Peaches continue quiet, with choice quoted at 7¼@7¾; extra choice, 7¾@8¼c, and for fancy at 9¼@10¼c.

CITRUS MARKETS

THE ORANGE MARKET.

We regret to report the condition of the orange market as anything but satisfactory. In the first place there is no point showing great activity or large volume of business even under the low prices pervailing at all points. Auction markets during the past week have sold early shipments at uniformly low prices, although there has been a little improvement in New York on Floridas, and we should feel this improvement should show in the price of Californais, but it tends to show that Florida fruit is appreciated more than our stock at the present time, on account of the eating qualities.

There is no demand in any section of the country for seedlings, all cars of this variety being very hard to dispose of.

The Western markets are not buying just at present for Xmas deliveries except on orders for shipment. Cars will be purchased much more freely next week spot goods.

Shipments have been very light from Southern California on account of market conditions, as well as fruit coloring slowly, but there seems ample going forward under the circumstances.

THE LEMON MARKET.

The lemon market has shown a great deal of weakness during the week and sales are far below those of two or three weeks ago. Demand is light and prospects unfavorable. The supply of foreigns is 25 to 33 1-3 per cent more than were in sight last year at this time. There is very little encouragement in sight for the immediate future.

AUCTIONS.

NEW YORK, DEC. 2.

H. H. Fruit Co., Silver lemons, $2.60. Squirrel, $2.20. Palm Tree, $1.80.

FILL THE EGG BASKET

The Foundation of Success in Poultry Raising

Eggs are the foundation of success in poultry raising. If you do not get eggs you will not make money, and no matter whether you keep poultry for pleasure or profit, results are what you want.

SUCCESS FROM ATTENTION.

Eggs are not a matter of luck. Hens do not "just happen" to lay or "just happen" not to lay, as some think; but success in poultry raising, the same as in any other business, depends mainly upon the intelligent attention paid to details.

THE FEEDING PROBLEM.

Now, every man or woman who raises poultry knows that of the many things requiring constant attention, nothing is more important than the feeding question. Fowls must not only have plenty of feed, but it must be of the right kind or they will not thrive and prosper; and unless they do there is failure in store for the poultry raiser.

POULTRY FOOD.

As for food, the Dairymen have learned how to feed for milk and butter, the Stockman for quick growth of meat and Poultrymen for eggs on one hand and meat on the other.

THE HEN AS A MACHINE.

In many ways we regard the hen as a machine for converting raw material into eggs and flesh, and she, like any other machine, must have proper materials for her work, for she cannot manufacture eggs unless you give her something to make them with.

AN EGG NOT A SIMPLE MATTER.

As you no doubt know, an egg is not a simple matter, but is composed of a variety of substances. We know that within the shell is everything required for the formation of the chick:—bone, muscle, tissue, blood, feather, etc., this being the case you can readily realize that a variety of substances is needed to make the egg, and as the hen gets them from the food she eats it stands to reason that unless this food is of the proper character, viz: containing all the egg forming materials in the correct proportions, she will not lay, or at least not to her fullest capacity.

A chick cannot grow or a hen cannot lay unless you give them the proper materials with which to make bone, muscle and eggs.

THAT'S PLAIN.

We know how to make good Poultry Food and we do it. Coulson's Egg Food, a balanced ration, ready mixed feed that makes hens lay.

In order to get the best results from your laying hens, it is necessary that you feed them a warm mash of Coulson's Egg Food. Profits from poultry depends on how and what you feed. When hens do not lay well or at all many owners think if they look rosy, plump and fat that is an indication that they surely receive ample supplies of proper food. But there is a science in feeding. Laying hens should be fed food that makes egg production and at the same time strengthens the hen.

In order to get best results from laying hens you should feed them Coulson's Egg Food, which is for sale at almost all feed stores. Get a ton, give it a trial and make more money out of your hens.

Loading Cars With Coulson's Egg Food

Fallon, Marin county, November 10.

Mr. A. R. Coulson, Petaluma—Dear sir: My chickens were dying of cholera at the rate of 7 to 10 per day until I had lost about 400 hens. On or about August 1st I your Mr. Miles called upon me and I purchased 50 pounds of your No. 3 Condition Powder and 1 bottle of Cholera Cure. I fed the hens I had left—about 700—7 tea cups full of No. 3 powder every morning in the mash, also put the Coulson's Cholera Cure in the drinking water according to directions, and sprayed the houses every day with a solution of crude carbolic acid and Coulson's Phenylene in the proportion of 1 gallon acid to 5 gallons of Phenylene, and I wish to say that, from the time I started to use your goods up to the present time I have not lost more than 20 hens.

And I also noticed that they were backward on the molt, but now the new plumage is coming on very fast and they look fine. I am perfectly satisfied and consider that your remedies helped me in more ways than one, for besides CHECKING and CURING the cholera they also materially helped the molt, and I can cheerfully recommend them to the poultrymen. Yours truly, James Fallon.

This recommendation comes from a locality where more than six thousand hens have died from cholera in the past three months, some poultrymen losing from four hundred to two thousand hens.

Here is another recommendation for Coulson's No. 3 Condition Powders:

A. R. Coulson Co., Petaluma—Gentlemen: My hens of which I have 1400 were dying at the rate of four hens a week. I purchased 50 pounds of Coulson's No. 3 Condition Powders last August. I put a little in their feed every morning and have not lost over six hens since. It is the best condition powder for poultry that I ever used and I can recommend it to all poultrymen. J. W. Dotters, Novato, California.

Antioch, Calif., Dec. 2, 1903.

The A. R. Coulson Co., Petaluma—Gentlemen: I have been using Coulson's Balanced Ration Egg Food for about six months and will say that my flock of birds, consisting of Barred Rocks, White Minorcas and Pekin Ducks (numbering about 450 birds) are looking better and have molted earlier than ever before, and furthermore, my old hens started to lay in November, two months earlier than ever before.

I am perfectly satisfied with your feed, for it does all you claim for it, and I can cheerfully recommend it to all poultrymen.

Wishing you success, I remain, Yours respectfully, Willis S. Rose.

P. S.--One pen of these Pekin Ducks took first prize at the San Francisco Show, Dec. 1-5, 1904.

Santa Maria, Cal., Nov. 25, 1903.

A. R. Coulson Co., Petaluma, Cal.

Dear Sir: I have used five sacks of your egg and feather food, feeding it to my hens during the molting season, and they kept on laying better than they ever did before during that period.

I can heartily recommend your egg food to any poultry raiser and it will do all that is claimed for it. J. R. Triplett.

CHICK FOOD.

If you like to see little chicks dive into the feed as though they like it; if you want to see little chicks always spry and healthy; if you want to have them grow rapidly and mature quickly; then you want to feed them the first two months on

COULSON'S CHICK FOOD

and you will be pleased with the way your little chicks are growing. No bowel trouble, no leg weakness on

COULSON'S GROWING CHICK FOOD.

Coulson's Chick Food will cost you more than some other feeds, but Coulson's Chick Food will raise the finest and largest chicks.

We take great pains and carefulness in selecting the grains, seeds and meals to be used in preparing the Food.

More than 200,000 pounds of the chick food sold last season and about a million chicks were fed on the Food.

Already this season we are receiving orders from dealers for thirty thousand carload lots. On one ranch near Petaluma of O. H. Puryine there is at the present time a flock of three thousand two hundred little chicks that are fed one ninety-pound sack a day of the Food, and the owner says he never had a flock of little chicks that eat and grow like these do.

Coulson's Food is the feed that little chicks like and it is the feed that makes little chicks grow.

If you are going to raise any chicks, give it a trial and you will be well pleased how nice your little chicks will be and how they will grow.

Yarnell's Vernon Nurseries

One of the best sales of nursery trees we have heard of this season was recently made by A. Yarnell of the Vernon Nurseries. It was likewise one of the best purchases, for, having seen the trees we can vouch for their being exceedingly fine ones, and a fine, thrifty tree is worth good money to any planter.

This particular sale was of 2000 first grade soft shell walnut trees, for which an even $1000 was paid. Looks like we would all wish to be nurserymen. But it isn't all one-sided. Thorough care and intelligent handling are necessary to secure trees of that kind.

Apple Nursery

Mr. Yarnell's nurseries are near the city of Los Angeles, south and east of Vernon. They are on land with sufficient moisture that but little irrigation is practiced—none at all on some of the stock. Yet all are so thrifty and strong growing as to attract instant attention.

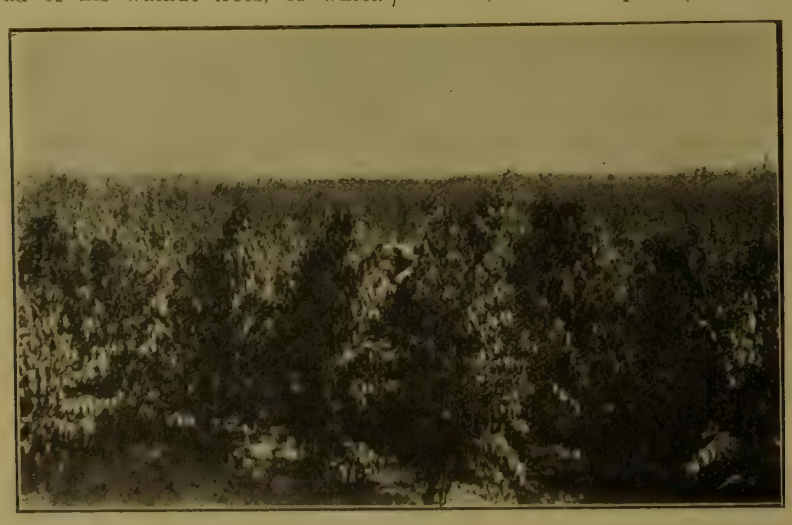
Walnut Trees, grown without irrigation

While Mr. Yarnell is particularly proud of his walnut trees, of which he has a large number, yet his entire stock of deciduous trees is of equally good quality. All told, he has about 100,000 trees. There are peaches from the earliest to latest varieties. In apples Mr. Yarnell realizes that the southern part of the State will need more of that king of fruits. He has the more desirable varieties of stocky, strong growing trees. 'Cots and prunes, persimmons and plums; in fact, nearly everything for the market or the home orchard.

While at the nursery it was the pleasure of the writer to eat grapes from vines which were cuttings last spring. That is thrifty growth when young vines will do that. Of grapes there are many varieties of table grapes, and all equally thrifty with the ones which had fruit on.

As Mr. Yarnell says, a day spent in looking over his nurseries is time well invested for much of value may be learned and the sight of such stock trees is a pleasure.

As may be noted, the bulk of trees of this nursery are deciduous orchard trees. Yet there is a nice line of ornamentals, such as palms, umbrellas, camphors, roses, etc.



Peach Nursery

While the nurseries are outside the city, some distance from the end of the Vernon car line, much of the stock can be seen at the yards which are at Mr. Yarnell's fine new home at 4524 Central avenue, Los Angeles, Cal.

Plums and Prunes that are beauties

CARE OF LINOLEUM.

Every block in a piece of linoleum should remain in its place until the linoleum is worn out. A quantity of water used upon it causes the glue that holds the blocks together to soften. Linoleum should be cleaned with a wet cloth and rubbed dry with one of dry flannel.

SOMETIMES.

Sunday-school Teacher—"Bobby, where do good people go when they die?"

Bobby (glibly)—"To heaven."

Sunday-school Teacher—"Yes, that is right. And if a person who is wicked all the way through dies, where does he go?"

Bobby—"To the police station."—Woman's Home Companion.

CALIMYRNA FIG TREES

The Calimyrna Fig is the genuine Smyrna Fig of commerce, the one fig that is fit for commercial purposes. It was developed and named by Geo. C. Roeding. It is grown true to name at the Fancher Creek Nurseries. If you want the genuine and original Calimyra Fig, buy direct and insure trees that are true to name, The reputation of the originator and of the Fancher Creek Nurseries is at stake, and no trees will be sold that are in any way questionable.

"The Symrna Fig at Home and Abroad," by Geo. C. Roeding, 87 pages illustrated, sent postpaid for 25 cents in stamps.

Growers of Trees and Vines of All Sorts.

Coulson's Food for Calves...

A special compound of food stuffs to be mixed with the milk, for

PREVENTING THE SCOURS

and an aid in fattening for the market. Promotes the growth of calves, as it is a great flesh producer. It prevents the scours and keeps Calves in good, healthy condition.

Directions for Feeding Calves.

Commence with small amount first, say about a handful, put in a pail—pour over it a little hot water to scald it (use scalding hot water to pour over it so as to kind of cook the starches in the food) then pour in the milk or skim milk. As the calf grows older you can feed more of this food, and instead of using a handful use a pint or a quart of the food with skim milk.

Coulson's Food for Calves is not only a developer, muscle and bone builder, but it is also an appetizer.

By the addition of Coulson's Food for Calves to the skim milk or milk, it is made more palatable and the calves will eat it readily and greedily.

Keep your calves in A1 growing condition by using Coulson's Food for Calves. It regulates the bowels and stomach and keeps the digestive organs in good shape so that they can do the work properly and the calves will grow and put on flesh rapidly.

Price 90-lb. Sack, $2.50; 50 pounds, $1.50; a small amount, 4 cents a pound.

Its cost is small, as it only takes a little of it for a feed. Prepared by

A. R. Coulson Co., Inc.,

Factory: First and E St. and 772-774 Main St., Petaluma, Cal.

Deciduous Fruit Shipments for 1903

BY ALDEN ANDERSON

The first carload of deciduous fruits for the season of 1903 consisted of a fruit express car of cherries and was shipped from Vacaville, Solano county, May 9th. The last car (apples excepted) consisted of grapes and was shipped from Concord, Contra Costa county, November 21st.

As will be seen from the accompanying statement, the shipments of this year exceeded those of last year by several hundred carloads, just as the shipments of last year exceeded those of the previous season.

In the figures given below are included 670 cars af apples. This number does not include all the apples shipped from California but simply those that have come under the cognizance of this organization in the same proportion as formerly. This fruit was distributed to a total number of 131 cities, being a considerable increase over that of any previous year. In fact, fruit was placed this year in no less than 28 cities that never before received California fruit in carload lots and while a few of the cities experimented with last season did not prove satisfactory car lot distributing points, and some of those experimented with this year are not yet ready for such shipments, the most of them will develop into regular distributing points. The largest quantity of any one variety of fruit handled outside this organization was grapes, and as the several outside shippers of this variety of fruit generally shipped only to one or two cities, at times there was a relatively greater amount of this fruit in some markets than there should have been. Otherwise there has been a comparative evenness in sales throughout the season in all markets.

* * *

Cherries—The crop of cherries was lighter than last year but was of good quality and ripened gradually, which made it possible to ship and distribute same in the best possible shape. Sales were very remunerative.

* * *

Apricots—More apricots were shipped than last year and as the crop in the early shipping districts was heavy the quality was not as good as usual. The prices on the whole were satisfactory.

* * *

Peaches—There was an increase over the shipments of last year. The earlier varieties were somewhat lighter and other varieties about normal. The best average net returns secured were had this year. This was particularly true in regard to later varieties, especially Salways, which held up at good prices until the end of the season.

* * *

Plums and Prunes—There were some 250 carloads less shipped this year than last year, but during the height of the sason daily shipments exceeded those of any single day last season. It required the utmost exertion and care to have the shipments properly distributed to the end that there would be no glut in any of the markets. Later varieties of plums were very short. Prices were very satisfactory.

* * *

Pears—The total number of cars of pears shipped was slightly less than last year, but the main shortage was in the fall and winter varieties.

* * *

Grapes—The greatest increase in any one variety was in grapes, there being 1802 cars against 1033 cars last season, the largest previous shipment of this product. Prices on the whole were even and remunerative and netted satisfactory figures. This, in view of the fact that the importation of Almeria grapes was greater than ever before known, is particularly gratifying.

* * *

The larger portion of the above fruits were handled by the California Fruit Distributors, with headquarters in Sacramento. This organization is composed of most of the principal growers, shippers and co-operative associations engaged in the fruit shipping business. They were organized in May, 1902, and immediately assumed all of the functions and duties of the organization known as the California Growers' and Shippers' Association, together with greatly enlarged powers, duties and responsibilities; their business being not only to give the utmost accurate information in regard to all shipments, etc., but to secure an even distribution thereof to all markets.

Membership in this organization is in no way qualified by the quantity of shipments made. The shipper of one car is given as much consideration as the shipper of a hundred. There are eleven directors, each of whom has a vote in the fixing of policies and the outlining of general business directions. The representation is based thus not on the volume of business done but rather on the individuals represented.

Before the organization of the present company, those engaged in the industry labored under many disadvantages that are now eliminated. Competition for business was keen, with no regulation of shipments. Each one endeavored as much as possible to keep his business from his competitor, for that purpose, billing all their cars to one city, making diversions that they kept to themselves while the cars were enroute, with the result, for instance, that a city like Minneapolis, where three cars of peaches might sell at good figures, was at any time liable to have three times that amount sent in by different firms, which would necessitate the selling price being cut to a minimum, while a city like Pittsburg might at the same time be without any fruit, whereas an equalization of the shipments to the two markets would have meant remunerative and satisfactory prices for all concerned.

The formation of the California Fruit Distributors was not an easy matter. Some firms, because of location or superior packing on their part, or better carrying quality of their fruit, enjoyed advantages not common to others. Some of them believed that if they could keep on with prevailing methods for a short time they would force their competitors out of business and they then would have the field entirely to themselves, while all the time they would likely be losing money for all concerned.

The general plan of operation of the California Fruit Distributors is as follows: They do not purchase or own a pound of fruit themselves, but simply act as a clearing house or agency for the different growers, shippers and associations working through them, who make their own carload shipments. When a car is loaded the bill of lading is endorsed over to the California Fruit Distributors and is sent, together with manifest and all pertinent information regarding contents thereof, to the company's headquarters in Sacramento. The car is then disposed of for the account of the party loading the same. Once the bill of lading and manifest of contents is received, the management aims to place the fruit in the best possible market for that fruit, taking into consideration the variety, its degree of ripeness, and general quality, and using their knowledge of the needs, requirements and local or domestic supplies of the different markets, together with previous shipments as a basis of action.

Not only have they complete and accurate information of all shipments previously forwarded, as they make all sales, diversions, and apportionments, but they receive telegraphic information daily from all leading centers stating present condition, prospective demands, amount and variety of local supplies and all other matters pertinent and necessary to the most intelligent distribution of the fruit.

The distribution of fruit to the auction markets is made with the utmost care and long experience in the business is called upon to direct what fruit should be sent to the different markets and to apportion to each market the relative proper amount of fruit to keep them all on a comparative equality, after taking into consideration the difference in the cost of transportation and refrigeration charges to the different points. Were California the only fruit shipping state the problem of distribution would be much easier, but there are other large fruit shipping districts, especially in the South, and their fruit comes into competition with California products.

* * *

The most serious problem to be solved now is the one of transportation. Little more can be done toward systematizing the selling and distribution or increasing the volume of shipments or taking the very best care of those already shipped until this important matter is worked out satisfactorily. We must have a regular, as well as an expedited service, to the end that we can know positively, barring accidents, just where a car of fruit will be at any given time. About 60 per cent of the shipments are distributed through the auction markets. No fruit is sold in these markets on Saturday or Sunday. Shipments are made from California on every day, including Saturday and Sunday.

* * *

The most strenuous efforts will be put forth by the California Fruit Distributors to obtain such a service and until such a service is had it will not be felt that the most vital necessity of the business is secured or the next most necessary reform accomplished. Other reforms and changes will have to and will be made, but little more can be accomplished until this stumbling block is out of the way. It is only because of the splendid carrying qualities of the California fruits and the intelligent packing and preparing of the same that they have been able to maintain their present position in the various markets and there is no reason why the industry cannot and should not be maintained upon a permanent, stable, remunerative basis on average results for all seasons.

Thus far, out of diverse interests, secrecy and undue competition has come a measure of order, system, stability and satisfactory returns, and while to favorable conditions in the East might be attributable a part of the result, it cannot be wholly so attributable, because never before in the history of the business has there not been times of glutted markets and red ink returns from some of the distributing points, and besides, the shipments this year were greater than ever before by several hundred carloads.

With a proper selection and careful grading of the fruit and an expedited scheduled freight service, and with possible reductions in charges in different ways from time to time, I believe that twelve thousand cars of deciduous fruit can be marketed from California with as good or better results in the future as has ever been attained in the past, and the organization and maintenance of the California Fruit Distributors is a long step toward that consummation. It is a long stride in the direction of intelligent and practical co-operation in the handling of one of California's chief products, with the consequent benefit to the whole industry and to the whole state.

OF GENERAL INTEREST.

Commerce and Labor—The reports of Secretary Cortelyou of the department of Commerce and Labor is a document full of interest to the public. After a full discussion of the importance of the work of the office, as an education factor which will enable both capital and labor to fully understand prevailing conditions by collecting and publishing necessary information, Mr. Cortelyou concludes by saying:

"The department deals with the great concerns of commercial and industrial life. To be of service to these interests it must have their hearty co-operation and support. It must be a department of business. It must be progressive, but at the same time conservative. It must not deviate in its course from the pathway of justice. strict and impartial. It must be nonpartisan in the highest and broadest sense. It must recognize no distinction, as between large and small interests, as between the affluent or powerful and the humblest citizen. If it attempts to occupy a field that properly belongs to private endeavor it w ll inevitably fail to realize the high hopes of its present well wishers. It must adhere rigidly to the lines marked out since the foundation of the government for Federal agencies in executing the will of the people. If these general principles are made effective, if conservatism and impartiality, coupled with ever-increasing efficiency, marks its adminstration, I cannot but believe that this new department will become a mighty influence for good in our commercial and industrial affairs."

* * *

A Forlorn Hope—Should the report prove correct, which has been published, that Colombia is sending 3000 men to attack the Republic of Panama, the world will witness another fiasco of the Spanish memory. Not only would the Indian tribes occupying the country between the Isthmus and the territory of Colombia object to the passage of an army through their providence, but the United States troops when landed would effectually block the march of an invading force. So if Colombia is determined on a fight, there is a probability it will be accommodated.

* * *

Don't Knock.—We do not believe that any company or organization of promoters is justified for a moment in misrepresenting the conditions which prevail in this state as to the wealth-producing power of fruit growing or of farming. That such misrepresentation is sometimes used cannot be denied. That it is not more often done is remarkable.

We believe that the two great railroads which send literally millions of copies of pamphlets and circulars, also Chambers of Commerce and Boards of Trade, send out statements of fact regarding the possibilities of this state which should mislead no one.

When we say possibilities we do not suppose, however, that all who may be influenced by such statements and enter into fruit growing will live up to those possibilities. It not only requires intelligence, capital and hard work to succeed in fruit culture, but to secure best returns, experience as well.

That the inexperienced come here, make certain failures, then, profiting by them, with determination and hard work compel success, is well known. That certain others stop after the first failure is likewise the case. The latter class should not condemn the state. Neither should particularly brilliant exceptions be taken as an average of the state.

But between these extremes is a measure of success which is secured by the vast majority of producers which has caused their numbers to increase until now there is a cry of over production. That is, some think that this cry is new and just promulgated.

But for all time such a cry has been raised, and will continue to be raised so long as any industry is growing. The production grows faster than the demand. The demand is increased by advertising, by education, and is created and increased constantly.

Many years since the cry was raised that over production of apples was coming. Millions of apple trees have since been set and today the price is several times higher than at that time.

This state has vast areas which need development. Let the investor determine what any particular section will produce to perfection, then produce the best of its kind and a market will be forthcoming. We believe any system of "knocking" is not only unwise and foolish but worse, it is a very great injury to the state.

It was most gratifying to note at the recent state convention that optimism prevailed and that the majority of growers are believers in the future greatness of their industry.

* * *

Farmers In Union—Reports come from Texas that the farmers of that state are going into a union at a rapid rate.

There are today 3000 unions in Texas, with a total membership of 40,000 or more, and the organization is spreading like wild fire.

About the middle of February next, a meeting will be held for completing a state organization, and it is believed the movement will spread to other states. The purpose of the union is to buy and sell in bulk, to educate along agricultural lines, and to eschew politics, but to nevertheless discuss political economy. Co-operation is coming. After the farmers once see the benefits of co-operation nothing will stop the establishment of co-operative institutions throughout the entire land.

* * *

Liable for Damages.—The decision of Judge Trask, in the injunction case, in which the California Citrus Union attempted to restrain certain Monrovia growers from disposing of their contract fruit outside the Union, does not seem to touch the merits of the contract between the contending parties. The decision holds that the defendant growers are subject to action for damages should they violate the agreement, and holds that as sufficient relief in case of such violation. What effect the outcome will have on the status of the Citrus Union's business no one seems to know at this time.

Edward Everett Hale—The selection of Edward Everett Hale as chaplain of the U. S. Senate, brings to that body a man of great intellectual strength and recognized religious convictions. It speaks well for the highest body of Congress that in the selection of its spiritual adviser it has gone outside the pale of politics and chosen a man of world-wide religious renown.

STATE FRUIT GROWERS' CONVENTION.

The fruit growers were honored on Wednesday at the convention by the presence of Governor Geo. C. Pardee. This is the third time in twenty-nine years that the State Convention has been so honored. The Governor entered the hall unannounced, and when called upon for a speech, proceeded to the platform unattended and in a most democratic manner. His address was the most eloquent of the convention. He reviewed the history of the state during its pioneer and gold mining days, and spoke of the wonderful changes that have taken place. He spoke of the part fruit gowers have taken in the development of the state, and the great reward that is ours. He concluded as follows:

"The question of transportation seems to me, so far as one who is as far outside the pale as I am can judge, of the utmost importance. We have two great railway systems, both utterly unable to take care of the business California offers them. Instead of taking your products quickly to the markets of the world, it takes time, which practically takes from them a value which should be yours.

"The question of pest on your vines and fruit trees is one receiving full attention from the government of the state. We believe that anything that will militate against your efforts is doing an injury to the state which the state should do everything to work against."

Hon. Chester H. Rowell, of Fresno, spoke of Raisin and Wine Grapes as an observer who has traveled much in this country and in Europe. Mr. Rowell was most hopeful of the future of the industry.

Percy T. Morgan, president of the California Wine Association, spoke of the wine interests from the standpoint of the association and showed how magnanimous the association is in paying such reduced prices. This was afterwards combatted most vigorously by some of the growers. Mr. Morgan is a believer in over-production and says that the consumption in this country is not one-fiftieth of that in France. Whether this slight consumption should be overcome by combatting the temperance forces, by increasing exports, by increasing output of unfermented grape juice or by reducing output, were points which Mr. Morgan raised.

T. C. White, of Fresno, spoke of the raisin outlook, which he did with much misgiving as to the future. This was because of two reasons: First, so many remain outside the association, and second, the apparent over-production.

One paper which created intense interest was that of Prof. Newton B. Pierce, which appears on another page of this issue.

By courtesy of the street railroad company, a pleasant ride was tendered the visitors in the afternoon. Some of Fresno's prettier homes, school buildings, packing houses, and some five miles out to Sunnyside amongst some of the largest vineyards, were features of the ride.

After the return, convention; but as it was a session wherein the scrap between the claimants that over-production and loss were staring the fruit growers in the face, and the optimists, there was not much benefit in it. Resolutions were introduced endorsing the work of the State Promotion Committee and referred to resolution committee. An effort was made to secure the appointment of a committee of fifteen to devise ways of getting all fuit producers together for one general fruit marketing.

President Cooper was called away by telegram which announced the death of a relative, and W. R. McIntosh and Harry P Stabler presided until the end of the convention.

In the evening Mr. Hartranft spoke on fruit marketing, commending the fruit auction and asserting that auctions could be established in California. J. A. Fletcher, secretary of the State Board of Trade and member of the World's Fair Commission, gave a rousing speech on the benefits to California from work done and exhibits to be made at the fair.

Robert Boot, president of the California Raisin Growers' Association, spoke on the raisin industry, which was largely historical and was an appeal to support the association. D. D. Allison, also of Fresno, spoke of handling the raisin crop and the benefits of co-operation.

The papers on Friendly Insects, by Alexander Craw; Insects of the Year, by Edw. M. Ehrhorn; Scale Pests, by Prof. Cook; Observations on Codling Moth, by Prof. Woodworth, and Spraying Operations in Pajaro Valley, by Prof. Clarke, all came Thursday morning, and will be given or quoted from in a later paper. The ladies session on Thursday afternoon was largely attended and was most successful. Some of these papers will be good reading for Cultivator readers later.

On Thursday evening one of the pleasant features of the convention was given in a reception tendered by the Ladies' Parlor Lecture Club. Joaquin Miller read a number of his poems and many local people added to the pleasure by recitations and songs. After the formal program a social time with refreshments followed.

Friday was closing day, yet most of the delegates remained to the end. The morning program was opened by Hon. A. M. Drew, of Fresno, on Needed Horticultural Legislation. He was followed by Geo. C. Roeding with an excellent paper on the Fig Industry of California; The Walnut, F. E. Kellogg, and the Report of Committee on Labor by Henry P. Stabler. Afternoon. Mr. Barnhill spoke of Advertising California and its Products; A. D. Bishop and Dr. S. M. Woodbridge on Fertilization.

Gen. N. P. Chipman was present and deprecated the pessimistic views which had been so freely expressed in the convention, and introduced the following, which was passed on a rising vote: "Resolved, that it is the sense of the California Fruit Growers, in convention assembled, that the fruit growing industry of California is in a general satisfactory and prosperous condition."

R. D. Stevens, chairman of transportation committee, fought this bitterly, but there was only one in the convention who stood with him on the final vote.

The usual line of resolutions were passed and the convention was over.

KEEP POLITICS OUT OF THE INSTITUUE.

Editor Cultivator: At the San Diego Farmers' Institute there was much merited complaint of the programme, in that it cut out much of purely necessary information to the farmers and orchardists, at this season, and admitted matter which was properly germain to politics. Whoever originated the programme made the serious error of mixing agriculture and politics—to the injury of agriculture. We say this in all good conscience, for at our coming meetings, let us hope, we shall have what interests us more than politics—a discussion of things pertinent to the farm, orchard, dairy and home. —A Member.

The point is well taken if the facts are correctly stated. The state is not paying its money to educate the people in political theories, that is the business of the politician and belongs to the forum.

The United States Steel Corporation will, on January 1 next, put into effect a general system of economy which will result in a reduction of wages of employes from 5 to 20 per cent. The sweeping order will affect over 160,000 out of 186,000 employes. All of the 186,000 however, will, within a year, suffer reduction in their wages. The startling condition of affairs in the management of the steel trust disclosed in the recent investigation has perpared the public for this action. Of course the employes understood what must come when they followed the course of the investigation.

The English cotton mills are closing down because of the high price of cotton.

Glendora Citrus Nurseries

Washington Navel, Thompson Improved Navel
Valencia Late and St. Michael Orange Trees
Villa Franka and Eureka Lemon Trees
DANCY and OONSHIU TANGERINES
"NECTAR" POMELO

This stock is one-year buds on two-year roots.

1,000,000 FANCY ORANGE SEED BED STOCK

A good look at these trees is sufficient to convince the most particular buyer—send for prices.

W. G. HALL - GLENDORA, CAL.

General Agriculture

Editor Cultivator: Is the Lenoir vine a resistant to the Anaheim disease? Please tell us in your next issue what you know about that.—W. R. Steele.

It is the most resistant stock known at present.

Will the walnut tree bear much trimming? If so, what time of the year is best to do the work?—W. H. E., Eagle Rock.

Walnut trees do not require the heavy pruning that is needed by most of the deciduous fruit trees. The lower limbs should start at 4 to 5 feet from the ground, and in such a way as to have the heavy side of the tree to the southwest. A good rule for pruning is to cut off only those limbs in the way of the team when cultivating, or that will tend to draw the tree too much toward the northeast, or away from the prevailing winds, until the tree has reached its tenth or twelfth year and has a spread of twenty-five or thirty feet of branches. After this the inside spurs will not bear fruit, and should be taken out so as to give more light and air to the inside of the tree. It has been noticed that trees which are open do not have as much blight as those which grow so thick as to keep out the air and sunshine.

Pruning may be done at almost any time the orchadist is ready, except that it is not good to prune too heavily at the time the sap is rising in the spring. Some pruning at this time will do no harm, and has a tendency to retard the blooming, which is an advantage in some localities. The general winter pruning may be done as soon as the nuts are gathered. Any excessive growth that is made during the summer should be pinched back, or cut off at once, as may be necessary to preserve the shape of the tree.

FORTUNES IN ALFALFA.

Twelve or fifteen years ago the farmers of comparatively isolated Humboldt county found themselves on the verge of ruin. Their lands were fertile, the rainfall was sufficient to meet all demands of agriculture, banner crops were year after year harvested, but the expense of getting bulky crops to market made cultivation profitless. The Humboldt farmer was saved by the introduction of alfalfa. Fields that had been planted to oats, wheat and potatoes and cultivated at a loss immediately became profitable. Soon dairying became second only to lumber of the industries of the county. Humboldt butter became famous from one end of the coast to the other. The weekly shipments were enormous. Mortgages of years' standing were paid off. Ready money became plentiful. Humboldt county, even during the years of depression which followed the panic of 1893, was prosperous—consumers had to have butter and were willing to pay for it, and Humboldt had butter to sell.

In the San Joaquin Valley much the same results have followed the planting of alfalfa and the turning of heretofore profitless grain fields into dairy farms. Kings, Tulare and Fresno counties have within five years made tremendous strides as dairy counties. Dairying brings to them ready money all the year round, the surest guarantee of continued prosperity.

In the Sacramento Valley, while alfalfa growing is on the increase, the possibilities which it offers have scarcely been hinted at. Nowhere in the State, perhaps, are the advantages for raising alfalfa what they are here. It is well known that alfalfa does not do its best in the coast counties; and yet Humboldt has grown rich from alfalfa fields; in the San Joaquin the conditions of soil and climate are not the best for it, but lower San Joaquin farmers are raising it and prospering.

In the Sacramento Valley wherever the raising of alfalfa has been attempted the returns have far exceeded those of either of the sections mentioned. Here the conditions for its growth are ideal, climate, soil and plenty of moisture uniting to that end. Three and four and even five crops a year are cut. But the possibilities of the Sacramento Valley for alfalfa growing and dairying have not yet been realized as in Humboldt county, or even in Kings. This year it is an encouraging sign to see farmers turning heretofore unused fields into alfalfa pastures. It is a serious beginning of an industry which will eventually be one of the most important sources of the valley's wealth.—Encinal.

CATALPA A FOREST WONDER.

How a forest of extremely valuable timber may be grown in a score of years, and made a source of profit within six to eight years, will be demonstrated in an interesting exhibit at the World's Fair.

That particular variety of the catalpa tree known as speciosa will be the basis for this exhibit and the great value and adaptability of this wood will be shown in all forms. The catalpa is indigenous to the Wabash bottom lands in Illinois and Indiana, but may be grown in any section of the United States. The tree is known nearly everywhere, but its great value is just beginning to be understood. Nearly every boy knows the tree because of the long and slender seed pod, which when dried burns much like tobacco, and is often known as the "lady cigars."

It is the worth of the timber, and its marvelously quick growth, that is destined to solve the problem of future railroad building and furnish a supply of lumber for all purposes.

John Green of Santa Cruz writes us as follows: "I like your paper very much. It is progressive and getting ahead of others in the same line. I think it the best farm paper on the Pacific coast." And why is it the best? and why is it winning such popularity? Probably because of the corps of practical, intelligent field workers and writers which are furnishing matter for these columns. The scissors cut but a small figure in the makeup of this paper. Original stuff fresh from the field and the California field is demanded by California readers. The Cultivator supplies this.

That this has been appreciated by the readers the above shows, and has been made plain to the writer of this in a trip up the coast when he has come in contact with many into whose homes the Cultivator goes, and the above sentiment is more than confirmed.

That's why the Cultivator has had such a healthy growth during the past year. A net increase of 3000 in subscriptions isn't bad.

The long-looked-for 10,000 subscription list will soon be passed. Then for something bigger.

* * *

Meantime the pleased people are the advertisers. The greater number of readers the more extended the publicity given to the article advertised. More coin to the advertiser.

The Stearns Gas Engine Works appreciate this, and are still hammering away on the Stearns engines. Simple to run and simple to understand. This they keep telling to 10,000 folks in each week's Cultivator. Ten thousand? Yes, 40,000, for you know about four people read each Cultivator. They don't all read a Stearns ad., but some do, then go in and buy a Stearns engine.

* * *

While in San Francisco the other day the writer of this passed a window at 41 Market street with as pretty a flowing water scene as you usually see. It proved to be the salesroom of the Byron Jackson Machine Works. We stepped inside at once and saw a little Olds engine running like it had greased ball bearings and was simply running because no one came and stopped it. From it a belt ran to a centrifugal pump—a Jackson centrifugal pump—and the way that little outfit was throwing water up in the tank in the window was a caution. And with it all the engine after exploding the gas would run several revolutions before requiring another explosion.

We wondered if the Jackson runs exceptionally easy and turned to ask a salesman, but everybody was so busy selling pumps and things that there was no one to enquire of.

* * *

Just a little farther down the street—No. 33 Market—we ran into the Petaluma Incubator Co.'s San Francisco salesroom. Busy? Well! Mr. Taft was just off the train from Los Angeles. He would hardly stop to look at a Cultivator man. And then Emerson came in fresh from the exhibit at the big poultry show, of which he has charge. And he hadn't much time for common newspaper men. But they had to stop long enough to show photos of the shipments of pullets to Australia to participate in the next laying contest. The last, it will be remembered, was won by American birds. These photos showed six contestants. There are nine birds in each coop. The contest is to be by six pullets, but three extra are sent for emergency.

Mr. Byce, president of the Petaluma Incubator Co., Mr. Taft and their associates have justifiable pride in their part in securing and forwarding those contestants which resulted in such signal honor to American poultry in the last contest, and we trust will do as well this contest, which will begin in February and last for six months.

The contest is held in Sidney, Australia, and is in charge of A. A. Dunnicliff, honorary secretary laying competition. The six pens forwarded are as follows: Rose comb W. Leghorns, J. Monroe Anderson, Muncie, Ind.; silver penciled Wyandottes, E. G. Wyckoff, Itahaca, N. Y.; White Ply. Rocks, D. V. Roots, Connellsville, Ind.; R. I. Reds, Dr. J. Martin, Wichita, Kan.; White Wyandottes, Wm. Bates, Rockville Center, Long Island; S. C. W. Leghorns, Henry Van Dresser, Cableskill, N. Y.

An old rancher says the best poison for gophers is strycnnine. Put a little of it in a piece of carrot or in a raisin and drop it in the runway and put an old barley sack or a board over the opening so as to shut out the light.

An orchardist says: To get the number of trees that can be put on an acre by the equalateral triangle system, calculate the number of the square system, then add 15 per cent.

To drive away ants, mix tartar emetic and sugar, equal quantities, and place it about infested quarters. Use it carefully, as its effects will be decidedly unpleasant if taken by persons.

CITRUS STOCK

Season **Navels** **Navelencias** **Valencia Lates** **1904**

All stock two years old on four-year-old roots. First-class in every particular. Large, healthy, clean. No better anywhere. Write us for prices.

Mills & Masters

JAS. MILLS, Mgr. RIVERSIDE, CAL.

RIVERSIDE NURSERIES, Riverside, Cal. Fullerton, Cal., Oct. 24, 1903.

Dear Sirs—It is with no small degree of pride that I point to the orange orchard that I set out in June, 1902, with stock from your nurseries. I am not acquainted with any orchard of similar age that has done so well, and is today so promising. This certainly speaks in no uncertain language of the character of the stock coming from your nurseries. Very respectfully, CHARLES CHAPMAN.

LAND AND WATER

BY A. J. MCCLATCHIE, PHOENIX, ARIZ.

DATE CULTURE.

Letters have been received recently from Brawley, Dinuba, Oakdale and Calexico, California, and from Overton, Nevada, asking for information concerning date culture, and especially as to where seeds and suckers of date trees may be obtained.

L. E. S., at Overton wishes to know if we have any "Southern raised seeds" to spare, saying that he would like to try some in that part of Nevada. J. B. A., at Oakdale, desires to know where he can procure suckers of the variety Rhars and what the cost would be. T. H. Mc., at Dinuba, desires to know where he can procure the best date palms, "either seed, young plants or shoots" to plant at Imperial, saying that he should of course want male and female. J. C. F., Brawley, also desires Rhars dates, either the plants or seeds for a ranch in the Colorado desert. He also wishes to know when is the proper time to ship and plant them. J. E. P., Calexico, desires to know how and when to remove and plant suckers from some imported dates received through the Department of Agriculture and set out last May. He desires to know the best time of year for transplanting palms and how old and how large trees may be transplanted. He too desires to know whether we have any seed or seedlings for distribution.

These queries indicate a growing interest in date culture in the Southwest, an interest which has existed for several years, as has been plainly indicated by the large number of letters received here making inquiries upon the subject.

The climate and soil at Phoenix seem to be very well adapted to the culture of most of the desirable varieties of dates. This fruit requires a dry climate, with the summers hot and the winters not too cold, just such conditions as exist over Southern Arizona and Southern California. The young plants endure without injury temperatures as low as 20 degrees Fahrenheit, and the older trees endure temperatures several degrees below this. The time of blooming is after all danger of frost is over, and most of the fruit ripens before the heavy frosts of winter. Therefore it is only the foliage that is injured by heavy frosts. The central part of the plants have never been killed by the lowest temperatures that have occurred at Phoenix. A few young plants have been frozen to the ground, but in each case they grew up the following season and by fall gave little indication of having been injured by frost. No summer weather is too hot for them. They make the most growth during the warmest weather of summer. For at least one species, the Deglet Noor, the season at Phoenix is not long enough, or the fall not warm enough. The season of ripening of dates extends from early September to January. Amhat and many seedlings ripen their fruit during September. The fruit of the variety we have at the Station farm under the name of Seewah as well as the fruit of the seedlings ripens during October. A few seedling trees about Phoenix do not ripen their fruit until November, but the most of them ripen it previous to this month. The variety we have under the name of Amreeyeh or Amhai ripens its fruit during December and January, being most too late a variety for our climate.

Like most other fruits, dates may be propagated by seeds; but, also like most other fruits, the fruit from seedlings is of an uncertain character. Not only is this true of the date, but the sex is also uncertain. Unlike most other fruits, the pistils and the stamens of the date plants are situated upon different trees and half of those that grow from seeds are likely to be males and hence produce no fruit, while but one of these males to about twenty females being necessary. The only way to secure date plants of definite sex and character is to grow them from suckers removed from the base of bearing trees. During the first few years of the life of a date tree it produces suckers at the base freely just as does its relative, corn. When these suckers are a few years old they may be removed and the trees that grow from them will be just like the parent.

The proper time to plant seed is during fall or early winter, but they should not be transplanted until the warm weather of spring or summer. As dates grow only during warm weather, they should be transplanted only during weather that is suitable for their immediate growth. The removal and setting of suckers or seedlings may take place any time during April, May, June or July. The suckers should be removed with some roots if possible, and after being set out should be watered daily for at least a month. If seedlings are transplanted they must be removed with earth about their roots. Only a small percentage will grow if they are transplanted without this precaution. The larger the plants the larger the amount of earth that is necessary to remove with them. All or nearly all the roots that are cut or injured in any way die back to the plant. Hence it is important to remove the plants without exposing any more roots to the air than is absolutely necessary and without injuring any more of them than is necessary. If these precautions are observed very few will die and nearly all plants transplanted during warm weather will start to grow promptly.

Suckers, on the other hand, are very slow in making a start to grow, and make very little growth during the first season. In fact, at the end of the first summer, they may appear to be dead, but unless the center of the plant is decayed, they may be considered alive and likely to make a start to grow the coming season. As long as some leaves at the very center are green there is hope for the future of the plant.

The Rhars date, concerning which several correspondents have made inquiry, is one of the promising ones in the experimental orchard of the Arizona Experiment Station. However, as will be readily inferred from what has been already said, seeds from these trees cannot be counted on to produce fruit like the parent. While some of the seedlings might be like it, as in the case of other fruits, there could be no certainty in the matter; hence the only way to be sure to get Rhars dates would be to plant suckers from Rhars plants. The Arizona Station will have some of these plants for distribution in about two years, but, unfortunately, at present none of the many requests for suckers from this and other varieties can be complied with. It is not considered wise to remove suckers until they have attained sufficient size to make it possible for them to get a start when they are removed. The only source of suckers from this variety at present is the old world.

CITRUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

TIME TO APPLY STABLE MANURE.

Editor Cultivator:—In the issue of November 20th, you discourage the application of stable manure on orange land during the fall and winter. Will you kindly tell when is the best time to apply? Also, I have an orange and lemon orchard, the land being disintegrated granite; have plenty of water. How can I best apply phosphoric acid as a fertilizer?—L. G., Sierra Madre.

Growers who have given the subject much thought and experimented at the same time are inclined to believe that nitrogen that is in an immediately available form, as is the case with barnyard manure, tends to make coarse fruit if applied just preceding the time of ripening. It is certain that the manure parts with its largest amount of nitrogen when it is first applied with water. It is also known that nitrogen produces or stimulates rapid growth and if given in excess produces sappy tissue. This is an undesirable condition for the tree or fruit at the beginning of cold weather. For this reason, we passed on the advice of our careful growers, to avoid applying stable manure in the fall and winter, but suggest that it should be applied in February or March. This brings the stimuius and the normal spring growth on at the same time.

The best method of applying phosphoric acid as a fertilizer is a problem that is still unsolved; at least in the minds of most growers. Some claim to have secured the best results from using a superphosphate. This is without doubt the best form as it is soluble in water and is carried with the water to the lower layers of soil. It is claimed that the phosphate soon becomes reverted into a water-insoluble form, but is much more finely divided and placed deeper that would otherwise be possible. In this condition and position it seems reasonable to suppose that the greatest good could be derived from it. The only apparent improvement on this method seems to be the use of phosphate fertilizers applied with some annual plant, preferably a legume. In such case, the annual plant takes up the fertilizer and with its rapid and highly assimilative working system, not only gets the element into a form that is easily taken up by the trees, but distributes it to all parts of the soil where the roots of the annual crops penetrate. This is deeper than it is possible to place the fertilizer by mechanical means. Roots of these plants penetrate much deeper than the fertilizer is placed.

* * *

SPLIT ORANGES. PRUNING ORANGE TREES.

Editor Cultivator:—Will you please tell me the cause of orange spliting and what is to be done to prevent it? Is pruning the way to correct an orange tree that resembles a deciduous tree, being open and its branches strangled?—F. W. W., Highland.

We would be delighted to give you an answer that would satisfy the question of "Why do oranges split?" The department at Washington has a man working on this problem. It has been discussed through the columns of this paper a number of times, and only theories have been advanced. No results from experience have given any satisfaction. It is believed to be some weakness of the navel, as the splitting, with rare exceptions, takes place at that point. There are always some splits each season, some seasons show more than others. We have noticed that some varieties, Jaffa for instance, produce fully 90 per cent of splits in some localities every year. This orange invariably has double navels, but they are more perfect than the navels in the Washington Navel. There is a theory that the navel provides an entrance for germs that might break down or weaken the tissues of the rind at that point. This would stop the natural development of the rind at that point and it must give way there in order to make room for the expanding pulp. This theory is apparently supported by the fact that seedling oranges, which have no navel, seldom crack; such cases do not have the splits always at the blossom end. Occasionally a Navel orange splits on the side. This all goes to show that the navel is not responsible for all of the splitting. We have no data showing that orchards fertilized in any particular way are more free from splits than others or vice versa.

Pruning of the orange should be confined to the cutting back of straggling branches and cutting out useless wood that forms in the interior of the tree. Open spaces will soon become filled by sprouts that grow out of them. An orange tree that has an uneven growth may be made symetrical by the heading in of the outreaching branches.

* * *

COCOANUT GROWING.

A subscriber wants to know if the cocoanut can be grown in California and what kind of soil is the best, water required and methods of culture.

The cocoanut may be grown in California along the coast where frosts are unknown. It will grow and thrive in interior locations free from frost, but will not produce crops of any account. It requires the salt brackish water to produce good crops. Soil that is pure sand and grit produces the cocoanut crops of commerce and the crop being one that yields very little profit, no fertilizing is ever done.

Cocoanut trees are started by planting the nuts on their sides in trenches. The husk is left on and the whole thing covered about 4 to 6 inches deep with sand. The nuts may be placed thickly in the trenches, and when the seed leaves are well started, they are taken out and planted about 20 feet apart. Weeds are usually kept out the first two or three years; otherwise no cultivation is given.

Care is required in selecting seeds for planting groves. Quality, productiveness and thickness of meat are the three points to be kept in view. The cocoanut is like other nuts and fruits; some seedlings are better than others, and as the trees cannot be budded or grafted, careful selection is necessary. The nuts must be perfectly ripe before planting.

DECIDUOUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

RUBBER ON THE COLORADO RIVER.

Editor Cultivator:—Wil you please tell me if the rubber of commerce can be grown at a profit on the Colorado desert when the government puts water on it?—J. C. D., Grass Valley.

It depends upon the temperature during the coldest period of the year. The rubber tree will not make a thrifty growth where the temperature falls below freezing point. Trees will stand some frost after they have made a growth of ten or twenty feet, but the young trees will be killed to the ground when 32 degrees is reached. There may be places on the Colorado desert where they will grow well. These places cannot be located without experience. We would look for better success in a humid atmosphere as that is the sort of condition under which the rubber trees grow naturally.

* * *

PRUNING EASTERN GRAPES.

Editor Cultivator:—Would you kindly inform us whether you grow the eastern grapes, Agawam and Lindley, with long canes on wires or cut back to three buds, as pruning on European stock is done at Florin and other places?—Subscriber.

The two varieties should be pruned long. Be sure to leave a spur with two buds at the base of each cane that is left long so as to be able to renew the vine without sacrificing the old wood or getting the vine out of shape.

* * *

LENOIR VINES AND ANAHEIM DISEASE.

Editor Cultivator:—Will you please tell me what you know about the Lenoir grape and the Anaheim disease. If it is resistant I would like to know it.—W. R. S., Compton.

It has been discovered that the Lenoir grape has a certain resistance to the Anaheim disease and also exerts a certain amount of influence on the vine which is grafted on it. We do not know how much we can rely on its power of resistance. That is something to be determined. Its most useful office may lie in its being used to cross other varieties on. Lenoir is a fairly good grape itself and no doubt will improve upon crossing and is very apt to transmit its power of resistance to the Anaheim disease to some of its offspring. We do not understand that it will render other varieties immune when grafted upon it to an extent that will warrant planting on a commercial scale, though it is perhaps after all the best resistant vine known today, all things considered, in the case of phyloxera. We would not hesitate to use the cuttings for stock.

TOPSY'S FULL NAME.

"Mamma, what is Topsy's other name?"

"Topsy in the play? I don't know, dear; I guess she hasn't any other name. It's just Topsy, that's all."

"O, she has another name. I heard papa speak it yesterday, but I can't think of it now. O, yes, I remember—it's Topsy Turvey!"—Kansas City Journal.

FINE NURSERY STOCK

We are now opening our sales yard at No. 632 S. Spring St., Los Angeles. We will soon have on hand a full line of northern as well as home-grown Deciduous Trees in quantity. Also some of finest Citrus Trees grown in the South. Having had between 26 and 30 years' experience in fruit and tree planting, we are enabled to offer suggestions as to best and most profitable varieties for Southern California. Ornamentals and Trees for street and lawn planting. Yours truly,

Fresno Nurseries

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

We call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

NO EXCEPTION

Last year we said the Tilton Apricot was a regular bearer. NEVER FAILS. This year is no exception. Every tree bore heavily; old ones as well as the newer planted orchards.

Fifteen Years' Test

and still the

TILTON APRICOT

Is a winner. Large, highly flavored, good color. In the dried fruits the Tilton won First Premium at the Great Central California Fair. Liked by canners. Original tree 18 years old near our nursery. Buy trees where you can get true to name buds from original stock from the Original Tilton Nurseryman. A thrifty lot of peaches and other deciduous trees.

J. W. BAIRSTOW, HANFORD, CAL.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A. B. C. OF INSECTS

(Continued)

It is now definitely proved that we owe malaria to mosquitoes. As with cattle that have had Texas fever, the person that has had malaria has the germs of the disease in the blood. These are minute Protozoans, known as sporozoans. They are, however, or may be benign, but once borne by the mosquito to the blood of another, they produce the dread disease that is so often fatal. We used to think that the mosquito was valuable in that the larvae or wrigglers ate the germs of malaria in the water of the swamps. We know now that the germs are not in the water at all. They are in the blood, and if not carried to the blood of another they would cease to do harm, and malaria would cease to work its terrible havoc. If we permit no water to serve as a breeding place for the mosquitoes, or if we use kerosene in the pools to kill all of the wrigglers, we would have no more malarial fevers. In just the same way if we could exterminate the Texas tick we would banish the Texas fever among our cattle.

* * *

The Bot Flies—These are curious insects. The mature flies have no mouth organs to speak of and so can not bite at all. They annoy the cattle, the sheep or the horses, as the case may be, simply by their buzzing presence. They lay their eggs about the sheep's nose. The maggots, often called grubs, work up the nose and kill sheep sometimes. Tar on the nose of sheep will keep the flies from laying their eggs. In case of cattle and horses the flies lay their eggs near the mouth, or in places that the animal cannot reach with its tongue. As the eggs hatch, the moggot is lapped up by horse or cow and in the horse passes to the stomach, while in cattle it works its way through the connective tissues to the back where it burrows and develops under the skin, causing the well known tumors. I must doubt if bots injure horses very much. The worst case of bots that I ever saw, I took from a horse that was drowned in fording a stream. The bots were very numerous and nearly grown, and yet the horse had never been sick a day in its life. Such cases are too common to be exceptions. I doubt if cattle bot flies do any great harm except as they perforate the skin and make them much less valuable in case the animal is killed and the hide is sold. I found cattle bot flies much less numerous in Machigan after the forests were somewhat cut away. I think the flies are favored by shade. All the bot-flies pupate in the ground.

I do not think I have said before that several families of flies live as larvae in water. Thus the mosquito is not alone in this respect. The long-legged crane flies, very common in California, often called daddy-long-legs, have this peculiarity.

* * *

Injurious Species—I shall have little to say of injurious species. I referred in the last article to the Athomyia. The maggots of these flies do serious damage to onions, radishes and cabbages in the East. They work just below the ground. They injure the radishes for eating and utterly destroy onions and cabbages. I found several years ago that I could destroy these by the use of bi-sulphide of carbon and not injure the plants. In fact, I constructed a little machine, much like a hand corn planter, by which I could apply the liquid very rapidly and use just the amount that I wished. I could apply the liquid as one could plant corn with a corn planter, and by stepping each time on the spot treated, the liquid was kept from volatizing.

* * *

The Trypeta—I was also familiar in Michigan with the apple Trypeta. This was at times considered a scourge. It was worse than the codling moth as there were several maggots in each fruit, and so one never felt safe in taking even a small bite. We know that the codling moth destroys only the part about the core. The affected apples, however, were easily felled to the ground, and I found that by feeding these to hogs or cattle it was not hard to hold the Trypeta in check. The Mexican orange maggot is also a Trypeta. It would also ruin the fruit utterly, and as the orange is not so ready to fall as the apple, I fear this insect would be much harder to successfully fight than the other. The flies of both Anthamyia and Trypeta are much like common house flies. The Trypeta have clouded wings. The pupa of all of these are always found in the ground. Another reason why we should be very zealous to prevent importation of the Trypeta is the fact that they seem to have few enemies. We cannot be too insistant in our efforts to keep this fly as also the white fly of Florida, which, we will remember, belongs to the bug order, from gaining entrance into our state.

* * *

The Hessian Fly and Midges—These flies, though very minute, much smaller, even, than the mosquito, are so prodigously numerous that they often cause tremendous damage. I doubt if any other insects in the country do more. They rank in this respect with the chinch bugs and western locusts. The Hessian fly works just at the base of the stalk under the leaf, while the midges destroy the kernel of wheat and the seed of the clover. Some of these little flies are brightly colored, either yellow or orange, and I have seen them so thick that the color was observable for a long distance. While the Hessian fly and wheat midge have done most serious injury to our American agriculture, often destroying millions of dollars' worth of wheat in a single year, yet I believe that the clover seed midge may prove the worst enemy of the three. Clover as a legume is so valuable in adding to the fertility of the soil and its destruction would be a national calamity. We all know that red clover, our best species, soon runs out, and so the ground must be reseeded. Of course, if the midge destroys all the seed, this will be quite impossible.

Sheep Tick—These well known animals of course are not ticks at all, but are wingless diptera. Farmers usually notice the mature tick and the rounded pupa, which they suppose is the egg. The egg, however, hatches inside the mother, and the entire larval growth precedes birth, so that the insect is born as the pupa. The larva lives in a sort of uterus and feeds on a secretion which, however, is absorbed, and not eaten.

* * *

BEAN WEEVILS.

George G. Mathews, Azusa, sends some beans that are fairly riddled with the grub of the bean weevil. I am asked to give ways to prevent such ravages. They were planted last spring and harvested in November. Though not Lima, they closely resemble that variety. They are pole beans, and bear well. Mr. M. sent some of the beans and they are badly tunneled. Some of them have a large number of holes in them and have fed as many grubs.

This is the common and destructive bean weevil, Bruchus fabae. The beetle is as wide as long and the elytra or wing covers are short so that they do not cover the tip of the body. Like the closely related pea weevil which they resemble not a little, they lay their eggs on the green pod and the larva or footless grub eats the young growing bean. The pea weevil stops here for that season, but not so the bean weevil. It continues to lay eggs and feed on the stored beans. We see how it is that the beans become so riddled with holes and why the beans become worse and worse the season through. There is but one brood of the pea weevil in a year and it only works on the green peas, and no more peas are injured after the peas are threshed. There are on the other hand several broods of the bean weevils and they work on the dried as well as the green kernels, and the beans become more and more injured the season through.

The remedy is the same for both these insects. They quickly succumb to bisulphide of carbon. If the grain is put in a close barrel, box, bin or granary, and the liquid turned on and the barrel, etc., quickly covered so that no fumes can escape, we will soon kill all of the weevils. A small teacupful of the liquid will do for a large barrel of beans or peas. In case of peas this will not lessen the damage for that season, but the weevils will be killed and can lay no eggs for the next year. We treat peas to prevent injury the next season. If no one would sow affected peas or beans, the evil would cease in our fields and gardens. With beans we accomplish all that we do for the peas and more, for we stop the work for the year, which otherwise would go right on for the whole season. In Northern New York they have special houses for treating peas and beans so that they can sell sound seed. I once visited St. Lawrence county, in Northern New York, and saw several of these houses.

* * *

BEANS.

Subscriber, Orange, asks if Lima beans will grow on gravelly soil, if they can be irrigated, and how much, if they can be grown in a small way, and how and when they should be planted. He also wishes to know how to plant peas to fertilize the orchard when they must be irrigated.

Beans can be grown on gravelly soil if not too coarse and loose. They would do better, however, on a loamy soil. Even a clay loam will give good crops if rightly handled. They may be irrigated and better be if they will not grow well without it. In the field this would be too costly. They are grown in Ventura and Santa Barbara counties without irrigation. It would be hard to compete with these growers if irrigation was necessary. They are planted in the spring as soon as danger of frosts is over and in the garden may be planted in hills and poled, and in the field in drills.

* * *

Peas for fertilizing the orchard should be planted in drills in September. The ground may be furrowed so as to permit irrigation when necessary. A little treated bone meal applied deeply in the soil at time of planting will help both orchard and peas.

* * *

DISTILLATE SPRAY.

Mr. John Thille of Santa Paula asks if distillate spray will kill brown and black scale on apricot trees. It will kill any scale that is not too far matured. Neither it nor fumigation will kill the mature scale. I should not expect that a well mixed two per cent. solution would injure buds. The time to spray, of course, is when the scale insects are young, so that all will be killed. I presume that September would be the best time to do this work. I shall be glad to see some of the brown scale that I may know the species.

* * *

TREES FOR STREET AND PARK.

Mrs. James A. Reese of Long Beach wishes advice as to how and what to plant on their streets. They wish to do it the best way. She also wishes me to advise as to planting their parks, and especially their school grounds. I would advise that Mrs. Reese get the Cultivator for October 30 and read what Mr. Braunton says on the subject.

GO TO GARDENA

Gardena is located in the center of the broad fertile valley between Los Angeles and San Pedro; has two electric lines giving the very best facilities for marketing products.

It is without rival in regard to climate, soil and water supply.

The soil is adapted to berries, alfalfa, vegetables, walnuts, etc.

To illustrate what can be done, we visited the model ten-acre ranch home of Messrs. Burge and Michael near Gardena. They kindly gave us an itemized statement of sales of produce for the year 1903. The walnuts (nearly 4 acres) were sold for $731.79; small fruits, vegetables, hay, chickens, eggs, cream, etc,, $818.77, making a total of $1,550 56. Can you ask for a better investment?

For Sale, 10 Acres, $4500

House of 6 rooms, barn, farming tools, hay in barn, 1 horse, chickens, etc. One acre in alfalfa, balance in orchard, mostly apricots. $2,000 cash, 6%, good time.

5 Acres, $2,000

Three acres young strawberries; balance alfalfa and garden. Horse, cow, buggy and farming implements.

5 Acres, $1,400

Two and one-half acres new strawberries,

20 Acres, $2500

One acre strawberries, 3 acres apple orchard; 7-room house; barn. Easy terms.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, sheds, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house and barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

Coast News and Notes

BY R. A. DAGUE, COR. SUTTER AND SANSOME STS., SAN FRANCISCO

HORTICULTURE.

Oranges are now being shipped out of Orange at the rate of about seven or eight carloads daily.

Half of the lemon crop of the Messina district (Italy) was destroyed by a terrific hail storm December 10th.

Several carloads of oranges have, this season, been shipped to Australia from Palermo, Butte county.

It is stated that large consignments of almonds will be shipped this winter to the United States from Italy.

The California State Floral society will hold an early spring flower show during the month of March, 1904.

The almond crop of Spain was so light this year, that American growers anticipate a good market for their goods.

Orange shipments from Lindsay, and Porterville, have for the past three weeks, averaged about 75 car loads per week.

The Santa Fe shipped 225 carloads of oranges from San Bernardino to eastern points the 8th, 9th and 10th instants, for the holiday trade.

The orange growers of Alhambra have orders for about 20 carloads of oranges for the holidays. The fruit this year is sweet and well colored.

The first carload of oranges to go out of Anaheim, this season, was the Thompson improved navel, and were from the orchard of Mrs. Langeberger.

The orange pickers of the Lindsey district, Tulare county, were paid 20 cents per hour, but last week struck for 25 cents. Most of the growers acceded to the demands of the pickers.

The shipment of dried prunes from Sonoma county is now lively. Until quite recently nearly all its shipments went to Europe. Now they are going to eastern cities.

California shipped 6,770,000 pounds of walnuts in 1895. They increased steadily until 1900, when we shipped 10,800,000 pounds. The output kept increasing until this year, when there is a shortage.

The prune growers of Santa Clara county are still holding for a 3 cent basis. The demand for the fruit in the east is increasing, and they believe they will soon get the price they ask, and that in a short time heavy shipments will be made.

Malcom Morrison of New Zealand is now in California studying our system of fruit growing. He says that many of the Burbank fruits are growing very successfully in Australia, and he hopes to introduce them and other California products in his country.

Last year the codling moth damaged the apple crop in the Watsonville district to the amount of $500,000. This year it is estimated that the efforts made by the university professors to destroy the pest saved the orchardists more than $100,000.

S. M. Woodbridge, of Los Angeles, professor in the academy of science of Southern California, recently spent some time in Tulare county studying the diseases of the citrus and deciduous trees there. As he is an accomplished chemist, his published report will be read with great interest.

The Santa Fe is expending two millions of dollars on their yards in San Francisco, which does not include cost of buildings. They have recently purchased the North Shore line, and will extend it up into the timber regions of Northern California. The general offices of the company will be removed from Los Angeles to San Francisco.

The Supervisors of Monterey and Santa Cruz counties, have made liberal appropriations to be expended in destroying the codling moth. The first expenditure is to be made in fumigating carloads of apples and large quantities of fruit in warehouses with hydrocyanic acid gas to destroy the eggs of the moth.

A very valuable book for California farmers is being printed by the United States government, which will be distributed at 50 cents each by the California Promotion committee. It will give reliable data regarding Pacific Coast climate, rain precipitation, and exhaustive treatises on the protection of citrus fruits from frost.

Professor F. E. L. Beale, United State ornithologists, and J. S. Hunter, of the California University, have given the bird pest a careful investigation in the orchards of the Pajaro valley. They killed 1,300 birds. They say that the birds are not pests, but benefactors, as they prey on the codling moth and other insects.

A mathematician has figured out that the apple crop this year in the United States amounts to 50,000,000 barrels, or 30,000,000,000 single apples; or 375 apples to every man, woman and child. He says 75,000,000 apples can easily be grown on a square mile, and that the entire apple crop now raised might be grown in one county of average size.

The Davisville Almond Growers held a meeting last week, when the secretary reported that the association shipped this season 253 1-3 tons; in round numbers 25 carloads of 10 tons each, valued at $48,069; of shelled almonds about 4 tons, valued at $1,400, making a grand total output of $49,469 for the season. The association's expenses for the season were $407.94.

AGRICULTURE.

Egyptian corn made a good crop this year in the Farmersville district.

The aggregate value of the products of all the farms in the United States is $5,000,000,000 per year.

The buckwheat crop, last year, in the United States, amounted to 9,566,966 bushels worth $5,341,413.

The farmers of Sonoma county, and other parts of Central California, are now generally engaged in following the plow.

The pea is a native of the south of Europe, and has been cultivated so long that history does not record its advent.

Farmers of Oregon got anxious over the prices of wheat, and within the past week sold 250,000 bushels at 65 cents.

Authorized agents are negotiating for several thousands of acres of lands in Grass Valley on which a large colony of Scandinavians will locate.

Representative Bell of this State, his introduced into Congress a "Pure Wine Bill." The chief purpose of the bill is to prevent wine adulteration and the use of false labels.

The Woodland cannery, this season, canned fruits and vegetables as follows: Apricots, 8,922 cases; peaches, 11,911; blackberries, 495; tomatoes, 17,025; beans, 763.

John Heaney has leased 350 acres on Merritt island, in the Sacramento river, and will plant it to hemp, and will remove his mill and works to that locality from Butte county.

The news of the partial failure of the cotton crop of the South, has had a damaging effect on the textile trade throughout the world. Some cotton mills contemplate suspension of business.

The grape season is just about over. The eastern market held good to the last. Among the last sold in Chicago brought $1780 and $1809 per car respectively. They were the Emperors and went from Fresno.

In Laramie county, Colorado, alfalfa raising was becoming unprofitable two years ago. Then the farmers began feeding it to lambs. This they found profitable. Now 300,000 lambs are being fed on alfalfa.

This is the middle of December, and yet there may be seen at our fruit stands fine strawberries, ripe raspberries, great clusters of grapes, green onions, green peas, ripe tomatoes and many other varieties of fresh vegetables.

Henry T. Oxnard, and the American Beet Sugar Company, will erect a

Coast News and Notes

CONTINUED .

sugar factory at Lamar, Colorado, at a cost of $1,000,000. Four thousand farmers have contracted to grow beets for the factory for five years at a stipulated price.

Returns to the chief of the bureau of statistics of the department of agriculture indicate that the newly-seeded area of winter wheat is about 32,000.000 acres, a decrease of 6 per cent. from the area estimated to have been sown in the fall of 1902.

J. F. Sullinger and other farmers, near Farmersville, this year, threshed their alfalfa. They got 300 pounds of seed per acre which they sold at 12½ cents per pound. This seed was derived from the second crop. The straw makes excellent stock feed.

Hawaii produced, this year, the largest sugar crop ever raised in the islands. Here is the official report for ten years: 1894, 166,432 tons; 1895, 149,627; 1896, 225,828; 1897, 251,126; 1898, 229,414; 1899, 282,807; 1900, 289,544; 1901, 360,038; 1902, 355,611; 1903, 437,991.

E. G. Williams & Son, of Lodi, got this season, the tip-top market price for grapes in New York. They were of the Morocco variety, and sold for $5 per crate. It cost but 80 cents per crate to lay them down in New York. Williams & Son will plant out larger vineyards of the Moroccos.

The Orosi Offer says that Horace Whittaker brought a bunch of barley to that office the other day containing over 300 stalks, the growth from one seed, from which 270 heads of well filled grain were clipped. The sample was grown on the Whittaker place, three miles east of Orosi.

Mr. McClosky of Antioch, has returned from Corea, and Japan, where he went last July, to investigate the methods of growing ginsing. So far it has not been much raised in California. Mr. McClosky procured a quantity of seed, and will plant it in Southern, Central and Northern California and hopes to build up a large industry.

The United States Department of Agriculture estimates that 233,000 tons of beet sugar will be produced in this country this year, to wit: In Michigan, 74,000 tons; Colorado, 44,000 tons; California, 62,000 tons. Eleven new factories have been established during the year—six in Michigan, three in Colorado, one in Utah, and one in Idaho.

The live stock men of the counties of Ventura, Santa Barbara and San Luis Obispo, held a convention at Santa Barbara, on the 7th instant. They met to devise ways and means for combating the Texas fever, which exists in those counties. Dr. Blemer, State Veterinarian, was present and made an address. It was decided that the "oil dip" should be tried. Owners are urged to excavate large ponds and give the animals the oil treatment.

M. B. Woodworth, U. S. District Attorney, has been investigating the Fresno Raisin Growers' Association to ascertain if it is an unlawful trust. He says: "I have been investigating the matter, and I have not yet reached a conclusion. It is not the policy of the administration to proceed against a combination because it is a combination, and the United States cannot repress a combination unless it is of an interstate character. The Administration will not seek to repress a combinaiton unless it is injurious to the public and puts up prices, and is in restraint of trade."

When Porter Brothers failed a few months ago, they had debts aggregating about $1,700,000. On the other hand they own several valuable warehouses in different parts of the State. The orchardists also owe the firm about $250,000 money advanced to the growers. Now it is said that the reorganized Earl Fruit Company, controlled by the Armours, will soon become owners of the Porter warehouses and other property, but notwithstanding the deal, the creditors of Porter Brothers will not receive over 30 cents on the dollar.

LIVE STOCK.

W. H. Brockman, recently lost 300 sheep by drowning near Nevada City.

New dairy buildings are in process of erection at Niles. The cow barn is to be 110 by 125 feet; 264 milch cows will be sheltered.

The feed for cattle is short in the mountains of Southern and Central California, and the stock is being brought down into the valleys.

The San Jose Mercury is authority for the statement that an ostrich farm is to be established in the Santa Clara valley.

About 125,000 sheep that were kept in the mountains this summer, have been driven into Kern county to winter.

France enforces such rigid sanitary measures against American fresh meat and cattle, that our trade with that country in that line, is very limited.

The Cutler Brothers, live stock dealers, of Tulare county, have sold the past three months, a good many hogs. A careful record of weights of those sold has been kept. They averaged 220 pounds each.

A poultry raiser says: Some farmers may smile at the thought of feeding hay to fowls, but they will find chickens very greedy to consume finely chopped steamed clover hay mixed with ground corn, oats, and other grains.

The Santa Rosa Republican, alluding to the steady weekly shipments of eastern poultry into San Francisco, says; California ought to be shipping great quantities of poultry east instead of having it come to us. This is a subject that should receive more attention in the Farmers' Institutes.

MISCELLANEOUS.

The counties of Tulare, Kings and Kern have agreed to make a joint exhibit at the St. Louis exposition.

The Patterson ranch of 400 acres, near Woodville, is being subdivided into small tracts and offered for sale.

The oil pipe line from Bakersfield to Point Richmond, that cost a large sum of money, is a failure. It will not transmit the oil successfully.

The Oscar Walton farm, near Yuba City, is being divided up into small tracts and sold at about $60 per acre. Some of the purchasers will plant their lands to almond trees.

The commerce of Panama amounts to about $3,000,000 per annum, its population to about 300,000, and its area to 31,571 square miles, or nearly equal to that of the State of Indiana.

The fruit drier of Colombet Brothers, in Santa Clara county, was burned on the 6th, together with 4,000 trays, 2,000 fruit boxes, a prune grader, an engine and other appliances. The loss is about $5,000.

In 1881 there was expended annually by the American people $900,000,000 for alcoholic liquors and in 1902 there was paid out $1,226,000,000, an increase in eleven years of $326,000,000 per annum.

Work has commenced to reclaim 41,000 acres in Kings county. Thirty miles of levee will be constructed, and the overflow waters from the Kings river, will be turned into the San Joaquin river. Fifty four-horse teams are now engaged in the work.

The Southern Pacific Railroad is, as rapidly as possible, converting their coal-burning locomotives into oil burners. Of their 1,400 engines, 650 are now using oil fuel. The officials say the oil fields of Kern county are exhaustless.

Four wholesale fruit dealers had their permits to do business on state property at the San Francisco wharf revoked because they violated the Woodward law, which forbid combination against producers and consumers. Now their attorney announces they will attack the constutionality of the law.

W. E. Hyer & Company

108 N. Los Angeles St., Los Angeles, Cal.

C. H. SESSIONS, ASSOCIATE EDITOR

TOO MUCH OIL CAKE AND PUMPKIN.

Editor Cultivator—I am seriously hampered with hard butter, can you advise as to feeding or the handling of cream to make a softer product and reduce labor in moulding, etc.?

Have two young Jerseys, fresh in October and November. Am feeding one pound each per day linseed oil cake meal mixed dry in alfalfa leaves, 40 to 50 pounds pumpkins, two feeds clean hay and one feed of clean corn stover cut and cured when grain was fairly matured but stalks green (grain is removed). Even the cream seems "tallowy" and have to churn at about 70 degrees. Butter flavor and color is good but is far too hard. Is the trouble with the cows or can I make a ration from the above feedstuff that will help.—"Home Dairy."

I would say you are feeding too much oil cake meal and pumpkins. Try about one-fourth pound of the former and not over 25 pounds of pumpkins and let them eat all the alfalfa hay they want. The corn stover will do no harm. If you were not churning at 70 degrees, I should advise doing so, but could hardly recommend any higher temperature. If this change of feeding does not help, please let us know and I will see if another combination can be arranged. —C. H. Sessions.

BUTTER THAT WILL KEEP.

In a paper read recently before the Minnesota Dairymen's association by Mr. B. D. White, it was pointed out that the most difficult thing in butter making is to make an article which will keep its flavor long enough to teach the consumer without any perceptible deterioration. The only difference between high grade creamery and low grade dairy butter is in the aroma and flavor. So far as the lubricating qualities, or the value as a food is concerned, the low grade is as valuable as the high grade and goes a great deal further and lasts longer. The public pays for the fine aroma and flavor in butter the same as it pays for high, delicately flavored goods of any nature. A housewife buys certain grades of flour, fruits, or certain parts of animals because of their flavor.

There is nothing which compares in delicacy with butter, and the delicate flavors sought for disappear and noxious flavors take their place; however, under certain conditions the fine flavor can be retained for a longer time. Just at what stage of the process of manufacture the product becomes contaminated, whether before the milk arrives at the creamery, during the time of making the butter in the creamery, or after it is made, is sometimes difficult to tell.

Perhaps 99 per cent of the creamery butter is edible, and would pass as marketable goods and would be consumed by the average person without serious complaint, if it would retain the aroma and flavor it had when it left the churn. Flavors of odors, whether good or bad, are absorbed by the milk, cream, or butter. Milk can have a bad flavor when it is drawn from the cow, caused by the cow eating strong scented food, such as grasses, weeds, or decayed vegetables. The flavor such as is produced by some weeds and is only perceptible to the taste, gives the butter maker more trouble than the odors which are volatile and easily detected by the smell, such as onion, garlic, or decayed vegetable flavors. Then there are the odors which are produced by bad smelling stables, cow yards, pig pens, kitchen odors, tobacco odors, etc., and last, the odors or flavors produced by bacteria which are caused by cows, utensils, and surroundings in an unclean condition. All such flavors are detected by the trained maker and the milk not up to a certain standard or which can not be manufactured into a first class article should be rejected, and is rejected in the well regulated creameries. All of these bad flavors have their effect on the keeping qualities of butter according to the degree the flavor exists; however, it depends largely upon the butter maker just how long they can kept down. The less there is the longer it can be kept covered up by the proper use of a good starter, and the more there is the sooner it will take the place of the good flavor and the sooner will the butter go off grade and depreciate in value.

FEEDING THE HORSE.

There is a palpable injustice done to horses, in this country, in scanting their feed. Teams are seen on the streets of our towns and cities every day that are hardly able to go about because of weakness from lack of feed. How can a farmer, a drayman or liveryman expect his horses to do good work if he starves them? How can a man do satisfactorily a good day's work when he is underfed. Physical life is sustained only when supported by nourishing food and pure drink. No horse is fit to work or drive that is ready to fall from ill treatment and starvation is ill treatment in one of its worst forms. There is no animal more necessary to man's comfort and pleasure than the horse, and there is no animal, except the dog, so meanly and persistently meanly treated. We usually feed the cows because if they are not fed they will cease to be of any service, but we starve the horse and still expect him to do the same amount of work he ought to do when given all he needs. It is a wrong every man guilty of should right, but if he does not the officers of the humane society in every county in the state should see to it that the horse which is starved is taken from the farm and the road and put into a veterinary hospital and adequately fed and the bill charged up to the owner of the animal.

Cows give a more regular quantity in winter and the milk is more uniform in quality than in summer, because the feed is of a regular quality and quantity in winter, but often very irregular in summer, owing to the varying condition of the pasture.

The weather during the week was cool and partly cloudy in most sections, becoming warmer toward the close. Light rain fell in the central and northern districts on the 12th and 13th. Heavy frosts occurred in nearly all sections at the beginning of the week, but no material injury resulted.

Early wheat and oats in the central and northern sections are in excellent condition and making good growth, but in the southern districts these crops are backward, owing to light rainfall. Green feed is abundant except in the south, and cattle are improving rapidly. In all places where the rainfall has been ample the soil is in excellent condition for cultivation, and plowing and seeding are progressing. The rain of the preceding week in Southern California was too light to improve the soil or pasturage.

Orange harvest is progressing rapidly in the different districts, and large shipments are being made for the holiday trade. Dried fruits are also being shipped in considerable quantities. The frosts have caused no material injury except to unpicked olives in some sections; the fruit became too soft for pickling and will be used for oil.

MINNEWAWA STOCK FARM

About Clipping Horses Just Before Winter.

Among horsemen there may be but one general opinion on the custom of clipping horses just before winter sets in, which may be in favor of the custom, such opinion being the result of practical experience, untrammeled by the theoretical argument, writes the veterinary editor of the Baltimore Sun. To an extent the clipping of riding and driving horses may be classed as a beneficial custom to the horse and its driver. When the clipped horse and its driver have a "waiting job," for a while outside a residence or a store on a cold, bleak day the driver will tell you how his teeth have been chattering in the cold and how his horse has been standing with "his four feet in a peck measure," so to speak, with his body all in a heap, shaking like an aspen leaf. But this is not the practical expericence referred to. The practical experience referred to is this: The horse is easier to clean and keep clean, dries off soon after entering the stable, and is soon made comfortable, whereas the unclipped horse continues damp and chilly all night and is found so in the morning.

The driver says, "O, the horse goes as frisky again when clipped, and seems more lively in every way, both going and standing still or stopping." Stopping is a better term, for the horse will not stand still very long. He wants to be on the move, instead, to keep himself fairly warm, and the driver keeps himself fairly warm trying to make the horse stand still.

We will not deny that clipping is beneficial, while standing about is not, to keep himself warm, and the horse blankets must be furnished for comfort to lower the risk of lung trouble or chills and what follows, but no covering will prevent this when exposure is allowed to go on till the body is chilled through and through.

If the bodies of the horses are clipped the legs should be held sacred to the clipper. Nature has furnished a splendid legwear to protect them from the wet and frost of winter.

The rain runs off the hairy legs and the hair maintains the heat beneath. Remove the hair, the protection from cold is gone, then cracked heels result and swollen extremeties follow as a reward for interference with nature.

Clipping the legs results in cracked heels, scratches and the disease treated recently in this column, i. e., lymphangitis.

Exposure of legs denuded of their natural covering in inclement weather gives rise to severe chill, the delicate glands and vessels become inflamed, the legs swell as a result, become hot and painful, the animal becomes lame and the doctor has a case which will give him some trouble and anxiety to put on the road again, for the least exposure during ordinary winter weather often brings about a return of the trouble.

Let a man having a full beard get a clean shave and then go around as usual; he will experience something of the exposure.

Work horses, light or heavy, should be allowed all the protection the legs can grow, and lazy horsekeepers should be encouraged to wake up and dry the legs every night, and during snow and slush let them rub some crude vaseline into the heels and down the legs; this will protect the animals from chills.

Carriage horses with a full service of coachmen and stablemen can enjoy the clipping season; that is, if the shopping and calls are limited to minutes, not to hours; but our friend, the horse, who labors, must have his health and somfort considered before he is handed over to the clipper. Let theory take a hand with practice, then practical experience will teach us correctly about the bane of clipping indiscriminately.

Solid grooming daily, week in and week out, will keep the coats of the horses healthy and bright, so that many horsemen will find clipping unnecessary.

CAUSES OF TAINTED MILK.

The Swiss scientist, Dr. Gerber, gives the following causes of bad or tainted milk:

1.—Poor, decayed fodders, or irrational methods of feeding.

2.—Poor, dirty water used for drinking water or for the washing of utensils.

3.—Foul air in cow stable, or the cows lying in their own dung.

4.—Lack of cleanliness in milking; manure particles on udder.

5.—Keeping the milk too long in too warm, poorly ventilated and dirty places.

6.—Neglecting to cool the milk rapidly directly after milking.

7.—Lack of cleanliness in the care of the milk, from which causes the greater number of milk taints arise.

8.—Poor transportation facilities, etc.

9.—Sick cows, udder diseases, etc.

10.—Cows being in heat.

11.—Mixing fresh and old milk in the same can.

12.—Rusty tin pails nad tin cans.

FALL CARE OF COWS.

In the feeding of dairy cows two seasons are recognized by the average dairyman. These are the winter feeding season and the summer season. In the former case the animals are entirely dependent upon what grain and fodder are allotted to them, there being no opportunity for grazing afforded. The very opposite of this is true during the summer season, the animals being expected to hunt their own living. The transition from one season to another frequently causes a falling off in the milk supply. This is particularly true in the fall when the ainmals are left to shift for themselves after the nights become cold. The fact is lost sight of that a dairy animal is of rather delicate constitution, and on this account cannot withstand the hardships which the beef animal can bear.

It is an exceedingly good plan to allow cows to have shelter at night after the first of October. If they are put in the stable or in sheds and fed a small grain ration night and morning, together with a little fodder, they will liberally respond to such treatment at milking time and will more than pay for the food fed in this way and the labor involved in caring for them. While the days remain warm they are just as well out in the pasture, as there is no food better adapted for milk production than is good grass. Grass is also economical, and for this reason one should endeavor to extend the grazing season just as long as possible. If pastures are getting a little bare, it will generally pay to haul a little fodder to the field. This may be corn fodder, sorghum, kaffir corn, millet, or any crops of this character. It is never a good plan to turn cows into frosted grass after having kept them in the stable during the night, it being much better to keep them housed until the grass is approaching dryness.—Midland Farmer.

SHADE FOR HOGS.

Hogs require more shade in summer than any other kind of domestic animal. The thick coating of fat confines the natural heat of the body by its property of non-conduction and prevention of perspiration. An ox or a horse can stand, without injury, day after day, a degree of exposure to heat that would kill a hog within an hour. A dense shade with free access to wind from any quarter, should be provided; and if in addition fairly clean water for bathing purposes is available, the hogs will appreciate it and pay for it in avoirdupois weight. In winter the best results are likewise obtained by having a warm, dry place in which to shelter the hog when at rest.

WARMTH FOR HOGS.

A prize essay on the feed and care of breeding hogs in winter, published in the Indiana Farmer, says the greatest foes to the health of breeding hogs are cold and dampness. The hog, like the human being, needs a warm, dry comfortable bed when at rest. Hogs should not, however, be coddled too much but those kept for breeding purposes require a great amount of exercise.

NATIONAL LIVE STOCK ASSOCIATION.

The seventh annual convention of the National Live Stock Association will be held in Portland, Oregon, January 12th to 15th, next. The governors of each state and territory may appoint three delegates-at-large with an alternate for each delegate.

OVER 64 QUARTS PER DAY.

Editor Cultivator—In the Cultivator of December 4, page 445, I find an account of E. W. Leffingwell's cow, that gives over 16 gallons per day. I want to buy that cow. I think that story equal to Jonah swallowing the whale. —A. Fuarey, Colton.

The trouble about that story is that it is not true, but if it were Leffingwell's cow would be so valuable that only a man like Rockefeller could buy her—no average dairyman need apply.

NEW CATTLE CARS.

The 'Frisco line is experimenting with a new stock car. Doors are placed at each end of the car, and each car connected, when loading or unloading, with gangway. An entire trainload may thus be filled from any one chute from the cattle pen, as the cattle are driven through the pen to the car most removed. When full the doors are closed and the next one filled, and so on.

Remember when you buy dairy cows, that you do not want beef animals, for they are inclined to lay on flesh instead of giving value received for their feed and care in the bucket.

Keep your separator and milk house clean. What is worth doing at all, is worth doing right.

Cows For Sale

Thirty Head Grade Jersey and Holstein Cows in first-class order and soon to be fresh.

Also Poland-China brood sows and Chester White pigs which will soon be ready to wean. Address

GOOD ROADS AND DAIRYING.

Perhaps no class of farmers is so interested in good roads as that engaged in dairying. The stockraiser, for example, markets his produce but a few times each year. The grainraiser the same; but the dairyman uses the highways from two to six times a week.

So closely allied is the subject of good roads with dairy husbandry that I believe the two should be more connected in public interest. Why not discuss the subject of good roads at our state and national dairy convention? Why not use our influence in every way we can to assist in the good road movement?

A new office in the Department of Agriculture, Washington, D. C., has recently been established. The office is called the office of public road inquiries. Recently the department has sent out a paper giving a list of the bulletins published in connection with the good roads movement. Under this list we find many valuable works connected with road structure and allied subjects. These bulletins can be obtained at nominal figures. Prices range from 2 to 5 cents. This sum will buy nearly any of these bulletins, so that the cost is low and it is an easy matter to become posted on good roads literature.

Bulletin No. 9, published in 1894, entitled "State Aid to Road Building in New Jersey," gives us a pretty good idea of how the state may be interested in the good road movement. Farmers' bulletin, No. 136, entitled "Earth Roads," is another valuable publication and instructive. This bulletin deals with the subject of country roads, especially those made from dirt. The west is especially interested in dirt roads, as in many sections of our country it is nearly impossible to obtain stone or hard material for road construction.

Why not agitate the subject of good roads, and why not the dairymen take a leading part in this movement?

THE ADVANTAGES OF DAIRYING

Dairying has many advantages over many other branches of agriculture, writes a correspondent. In the first place the very important matter of keeping up the fertility of the land is conserved better by devoting it to this business than if it is yearly cultivated in the usual crops and the product hauled off and sold. Almost all the sources of fertility in the dairy farm are returned to the soil, and it will increase in value from year to year if rightly managed. But the dairy men must study the methods of the great packing houses and let nothing go to waste if they expect to make the business profitable. The milk and butter alone will in all probability net them a sufficient income to make a living and put a little in the bank each month, but their profits will be much greater if they will keep an eye on the by-products as the packer does. The calves are one of these products, and they can be very cheaply raised on skim milk, with the addition of some other suitable food. As the calves are not capable of consuming all the skim milk produced on the farm, the pigs should be on hand to assist in disposing of that article as well as the buttermilk, upon which they will thrive and grow fat, only needing a little finishing off on corn to make them good marketable animals that will greatly assist in making the farm a good investment. After the pigs will come the chickens, which are partial to both buttermilk and skim milk and will produce eggs in sufficient numbers to pay for their care and will need but little else as a regular feed. Then when the time comes the flock is sold and considerable addition is made to the income of the owner. These by-products will represent the cash profit on the investment, while the milk and butter will pay for the running expenses and for the labor involved. But the great profit is one which is not always visible and is one which is not regarded as seriously as it should be. We refer to the manure saved annually to the fields, which is constantly enhancing the value of the farm.

An old dairyman, quoted by Hoard's Dairyman, was once talking to a lot of creamery patrons and used this language: "A great deal of your milk comes to the creamery in an unfit condition. You know that I am not going to assume that you are ignorant of your duty. Like myself, you do not do half as well as you know. We both too often sacrifice our conscience to our convenience. We are not full-fledged, four-squared dairymen yet, making the business and all its demands, our pride, our honor, our chief concern. We keep cows, but how do we keep them? Not half as clean as we do our cornfields. Why? Because we do not have half as much pride in our cow work as we do in our corn work. When the creamery patron becomes just as keenly alive to the reputation of his creamery as he wants the butter maker to be; feels his importance in it and his responsibility to it, realizes that one pound of dirty milk will spoil 100 pounds of clean milk, then we will make butter that will beat the whole world." Commenting on the foregoing the editor of Hoard's Dairyman says: "Now that was the truth and nothing but the truth from the patron's standpoint. It was a faithful, honest, brave statement, and faithful, honest men always welcome that kind of talk. But this business of making fine butter is a very wide proposition. It does not all rest on the farmer who produces the milk. Of great importance is the study of the scientific side of it, the skilled training in the work; the sharpened perception of the taste, the smell, the eye, and all that goes to make what we call expert judgment."

The Texas Stock Journal says: "Mrs. H. D. King, the largest individual ranch owner in the world and one of the very few wealthy women of America, was in Fort Worth last week. Her estate is valued at $25,000,000, including over 1,000,000 acres of deeded land and between 75,000 and 100,000 head of cattle. This is the first trip Mrs. King has made to Fort Worth in about twenty years. She has valuable real estate in this city as well as in New York and St. Louis. She is a woman now over 70 years of age, very active for one of her years, and is modest and unassuming."

MONEY IN PIGS.

Six years ago a daughter of Doctor W. Seward Webb, in order to show her business ability and to obtain a little additional pocket money, took a little "flyer" in stock-breeding on Shelburne Farms, Doctor Webb's country seat on Lake Champlain. She invested twenty dollars in a brood sow, and with her father's permission made arrangements with her shepherd to care for the sow and the pigs. As there was an abundance of skim milk, this was given her without cost, but all the grain fed was charged for at market prices. From this single investment she cleared ninety dollars the first year, two hundred dollars the second and three hundred dollars the third. By this time the stock had so increased in numbers as to outgrow its quarters, and was proving so profitable that Doctor Webb thought it advisable to buy her out. So at the end of the fourth year he took over the stock at market prices and gave her a check for seven hundred dollars, which represented the year's profits. From this start the present piggery has been developed, which is the most profitable department of the place. The past year two hundred pigs were sold, averaging from two hundred and fifty to three hundred pounds in weight and bringing one-half cent per pound more than the ruling market prices, because of the superior conditions under which they are kept. The piggery is a model of its kind. The building is in keeping with the others on the place in exterior style, and the interior is finished with hard pine, cement floors and iron troughs and fixtures. —Country Life in America.

LIST OF POULTRY AWARDS.

The Los Angeles poultry show, which closed on Saturday in a blaze of glory, was, without doubt, the greatest exhibition ever given in Southern California. There was more interest manifested among poultry keepers, among fanciers generally and by the public at large, than has heretofore been noticed. All of which goes to show the importance the poultry business is assuming in the minds of the people.

Following is the complete list of awards made by the judges:

White Leghorns—Pens: first and second, W. W. Howard, Los Angeles; Cocks: first, W. W. Howard; second and third, G. I. Lytle, Los Angeles. Cockerels: first, second and third, G. I. Lytle.

White Wyandottes—Pens: first, E. R. Holman, Anaheim. Hens: first, E. R. Holman; second and third, Ben Vlier, Pasadena. Cockerels: first, second and third, Ben Vlier. Pullets, first and third, E. R. Holman; second, Ben Vlier.

Buff Plymouth Rocks—Pens: first, Dr. T. B. Keys, Fresno. Hen: first and second, Dr. Keys; third, G. H. Heady, Los Angeles. Cockerels: first, Dr. Keys. Pullets: first and third, Moneta.

Dr. Keys; second, F. M. Thornton, Columbia Wyandottes — Cockerels and pullets: first, Mrs. H. A. Weller, Los Angeles.

Silver Penciled Wyandottes—All awards; C. H. Young, Los Angeles.

Partridge Wyandottes—All awards: C. Andrews, Los Angeles.

Partridge Plymouth Rocks—All awards: Mrs. A. Albutt, Los Angeles.

Barred Plymouth Rocks—Pens: first and second, S. M. Butler, San Bernardino; third, Fred Espe, Los Angeles. Cocks: first and second, S. M. Butler. Hens: first and second, S. M. Butler; third: A. A. Clapp, Alhambra.

Silver Wyandottes—Cocks: first, H. T. Hohenshell, Elsinore; second and third, Fred Wilson, Los Angeles. Hens: first and second, H. T. Hohenshell; third, Fred Wilson. Cockerels: first, Wilson; second and third, Hohenshell. Pullets: all awards, Hohenshell.

White Brahmas—All awards: John Russell, East Oakland.

All breeds Orpingtons except buffs—All awards: P. M. Burbridge, Los Angeles.

Golden Wyandottes — Cocks, all awards: Mrs. H. A. Wells, Los Angeles.

Indian Games—All awards: J. H. Hartwell, Long Beach.

Toulouse Geese—All awards: Brookside Farm, Los Angeles.

White Plymouth Rocks—Pens, first and second, T. M. Butler, San Bernardino; cocks, first, Rhoda E. Durfee, Santa Ana; third, S. M. Butler. Hens: first, S. M. Butler; cockerels, first and second, Rhoda Durfee; third S. M. Butler; pullets, first and third, S. M. Butler; second, R. E. Durfee; first and third, S. M. Butler; second, Fred Espe; pullets, first and third, S. M. Butler; second, A. A. Clapp.

Black Minorcas—Pens: first, Harry E. Rose, San Gabriel; hens, first, second and third, Harry E. Rose; cockerels, G. I. Lytle; pullets, H. E. Rose.

Buff Orpingtons—Pens, first, Royal Yards; second, Mrs. O. B. Smith, Long Beach; cocks, Arthur Letts, Los Angeles; hens, first, Mrs. O. H. Burbridge, Los Angeles; cockerels, first, Mrs. O. B. Smith, Long Beach; pullets, first, Royal Yards, Los Angeles; second, Mrs. Smith.

Buff Cochins—Cocks, all awards, MacIntyre.

Buff Cochin Bantams—All awards, H. H. Holland, Fresno.

Blue Andalusians—Pens: first, Mrs. T. R. Griffith, Los Angeles; second, Inglenook yards, Garvanza. Cocks, first, H. H. Holland, Fresno; hens, first and second, Mrs. Griffith; third, Inglenook yards. Cockerels, first and third, Mrs. Griffith; second, Inglenook yards. Pullets, first, Mrs. Griffith; second, Inglenook yards.

Brown Leghorns—Pens: first, E. W. Bass, Los Angeles; second, Joseph Vlasek, Los Angeles; third, Fred Lenz, Los Angeles. Cocks, first, W. E. Mercer, Ventura; second, Fred Lentz, Los Angeles. Hens, first and second, W. E. Mercer; third, E. W. Bass and wife. Pullets, first and second, W. E. Mercer.

White Leghorns—Pens: first and second, A. Howard, Los Angeles. Cocks, second and third, G. I. Lytle, Los Angeles. Hens, second, G. I. Lytle, Los Angeles. Cockerels, first, second and third, G. I. Lytle.

Black Langshans—Cocks, first, J. M. Wright, Pasadena. Hens, first and second, J. M. Wright. Cockerels, first and second, C. T. Renfew, South Pasadena; third, J. M. Wright. Pullets, first, second and third, C. T. Renfew.

ONE SIDE OF THE STORY.

"No! chickens don't pay," said an eminent New York lawyer to me yesterday. "Father found that out," continued he, "when we lived in Minneapolis. He bought a big incubator. I think it held about four hundred eggs. I know it was so large it had to be in his art gallery, forty feet square; well, with the first lot of eggs the lamp went out and they all froze. The next lot the lamp did not go out, but something went wrong with the coniptian that regulates the heat; no, the lamp did not go out, but all those eggs were baked. This was getting to be a serious matter, but father thought it might succeed the third time, so the incubator was again filled with eggs, and the whole family was detailed to keep the thing running right, and this time to his great delight the eggs hatched out; they were neither frozen nor baked.

Then we all had to herd those chickens; each of us had a certain number to herd, but I suppose the little beggars were cold, or needed an old hen to creep under, for they kept pushing under each other until they were a little pile in the corner over a foot high and the bottom ones were smothered to death.

"Father then bought a sort of tin thing with a lamp at one corner and rags hanging down, I think it was a tin water tank about two feet square. "A sort of artificial mother," I suggested. "That's it," was the reply; "the chickens scooted under those rags and got on all right."

"But Uncle Jim, didn't the measles catch them?" said a small boy. The weasels, not measles. Yes, weasels and skunks and even the watch dog ate chicken till they soon disappeared and father decided that chickens don't pay. He had invested a good many hundred dollars and lost it all."

Moral: Don't try to raise chickens unless you know how. The aforesaid old gentleman handled millions of dollars successfully, but could not raise chickens.—Mrs. A. Basley.

POUTRY POINTERS.

When chickens grow very fast, it sometimes causes leg weakness.

Under usual conditions a variety of food is better than any medicine that can be given.

The only safe way of disposing of dead fowls that have died of any contagious disease is to burn them.

Clover contains two elements that are in demand by the hens—nitrogen and lime. It is rich in the elements required for the whites of eggs.

When roup gets into a flock, it invariably leaves some ailment behind. The fowl that has been subject to it is seldom healthy again.

There is no cure for feather pulling except by more labor and time than an ordinary flock is worth. The best plan is to get rid of the guilty fowls as soon as possible.

A hen seldom begins to eat eggshells until she finds one broken or until she becomes accustomed to eating eggs thrown out into the yard. The safest plan is always to crumble them up fine before feeding.—Napa Journal.

100 S. C. White Leghorn Pullets, the pick from 300 beauties mated to two-year-old roosters that cannot be beat. Eggs $1.50 per 15; $5.00 per hundred. M. L. CURTIS, Los Soso Poultry Farm, San Luis Obispo, Cal.

EGGS

Buff Leghorns from Chicago world's fair prize winners, $2.00 per 15.
Buff Orpingtons, Harris strain, Clay Center, Nebraska, $1.50 to $2.00 per 15.

SHOEMAKER'S BOOK ON POULTRY

and ALMANAC for 1904
There is nothing in the world like it. It contains the following: 212 large pages, handsomely illustrated. A number of most beautifully colored plates, true to life. It tells all about all kinds of Thoroughbred Fowls, with life-like illustrations and prices of same. It tells how to raise poultry successfully and how to treat all diseases common among them. It gives working plans and illustrations of convenient Poultry Houses. It tells all about INCUBATORS and BROODERS. It gives full instructions for operating all kinds of Incubators. This chapter is marvelously complete and is worth dollars to anyone using an incubator. It gives descriptions and prices of Incubators, Brooders, and all kinds of Poultry Supplies. In fact, it is an encyclopedia of chickendom and will be mailed to anyone on receipt of only 15 cents. Your money refunded, if not pleased. Address

EARLY BROILERS.

At the Los Angeles poultry exhibition was shown a variety of fowls each of which had some characteristic that made it especially valuable. One of them was the Buff Cochin, a beautiful bird quickly grown and especially of value to the table. The owners claim for it quick growth and delicious flavor as a broiler. Discussing this question of earily broilers with a poultry raiser he strongly recommended the use of the incubator. He especially favors its use in winter, while many poultrymen and farmers raise chicks in the spring it is because at that season the hens are more inclined to become broody. The proper period for hatching early broilers is in the late fall and winter, which is also the most suitable season for incubators. The great obstacle to the production of early broilers is that the hens will not incubate until they are ready to do so of their own accord. By the use of the incubator chicks can be hatched at any time. It will thus be seen that the one has nothing to do with the other, all that is dependent upon the hen being the laying of the eggs, and in that respect she has no substitute. The laying of eggs is done at the least expense in those months following March, and ending only when molting begins, while hatching and raising chicks is done from the molting-season until March ends. The year is thus divided into two periods, and into two separate industries, both of which give better results than either alone. The incubator cannot lay eggs, but can hatch them, while the hen can lay eggs, but will not hatch them until she so prefers.

SHELTER CONTROLS EGGS.

The West Virginia Experiment station gives a timely and interesting report showing the difference in egg production where the same food and same care was given two groups of pullets. One group was warmly housed, while the other was sheltered in a cold house. There were five periods of time accorded the fowls of 30 days each. The record was as follows for eggs produced:

Warm house	725
Cold house	425
SECOND PERIOD.	
Warm House	1,083
Cold house	866
THIRD PERIOD.	
Warm house	1,150
Cold house	858
FOURTH PERIOD.	
Warm house	1,000
Cold house	1,033
FIFTH PERIOD.	
Warm house	1,281
Cold house	954

It will be seen that the hens in the warm house laid 1,103 more eggs than those in the cold house during the time allotted to this test, which should be conclusive evidence of the advantage of warmth in the production of winter eggs. It was a profitable investment as well as more humane to provide warmth for the biddies.

With windows properly prepared and a drop curtain of some kind to exclude cold on midwinter nights to cover them there will be a saving of food and a saving of sufferings with farm fowls.—Baltimore Sun.

NOT OVER DONE.

A writer in the Petamula Poultry Journal discusses the question whether "the poultry business is over done." We in San Francisco who are just now paying 60 cents a dozen for eggs and 35 cents a pound for Thanksgiving turkey—if we have the money—are decidedly of the opinion that it is not overdone in the matter of supply, although possibly it may be in the matter of charging. From the poultryman's standpoint the greatest need seems to be co-operative cold storage and co-operative marketing, so that those who bear the expense and risk of the production of poultry may enjoy the profits. The prime requisite for accomplishing these ends is the possession of collective energy and business ability among the poultrymen. We do not know whether they have it or not. They are trying to find out over in Petaluma.—S. F. Chronicle.

POULTRY NOTES.

Cleanliness about feeding places is essential.

To keep the fowls healthy is one of the first requisites.

Where confined, laying hens should have meat or milk.

Breed out the long boned fowls and breed in the short legs.

From this on through the winter feed whole corn at night.

Fowls must depend on the grit supplied to them to grind their food.

Learn to dry pick chickens without tearing the skin, instead of scalding them to remove the feathers.

Late broods of chickens need a warm place, as they are easily stunted if exposed to cold.

In building poultry houses, remember that the most important requisites are light, ventilation and warmth.

Never breed pure immature fowls, no matter how handsome or perfect in looks they may be.

If the hens cease laying change their previous rations, giving them either more meat scraps or milk.

The pleasures of poultry keeping, the profits of the business, and the health of the stock, depend more upon the cleanliness of the premises than any other one thing. The practice of having the roosting-poles over the nests in the alley, having dropping-boards to collect the offal, and infrequent cleanings, make the owner ashamed to take guests to the poultry-houses, and the odor drives them away if they do go. Looking over ill-smelling roosts disgusts the visitor, and he sees no beauty in the flock.

BUSINESS NOTES.

Mr. Theadore Payne who has succeeded to the ownership of the nurseries formerly belonging to Hugh Evans has fitted himself for his calling as few others have. After years of experience in practical nursery work he traveled in the east and in Europe where he widened his knowledge of other methods of work. Not only that but he has a fund of information as the best and most reliable growers of flower seeds by which he is enabled to select the choicest of the earth. This will enable Mr. Payne to increase the popularity of these nurseries which have made such a specialty of ornamental trees, plants and flowers. Shade trees are the largest of any feature of the nursery. Live oaks—and there is no prettier shade tree—Stermlias and acacies are all in large quantities in the nursery.

The Krucheberg Press has just issued fine specimens of work in the form of price lists for the Armstrong Nurseries of Ontario and Henry Albers of Los Angeles. Krucheberg "saveys" printing from start to finish, especially in horticultural or nursery lines.

The Cultivator erred last week in the notices of the Los Angeles Poultry show wherein we referred to the display of Los Angeles Incubator and poultry supplies as being that of Geo. R. Albers. Now when it comes to a big lusty Black Minorca crow, Geo. Albers is in it, but the biggest poultry house in these United States which also makes the famous Los Angeles Incubator is owned and managed by Henry Albers who has advertised in this, the best of farm papers lo, these many years, until his name is a houshold word in the homes of this state. This was well known to the writer of this little item last week, but by a mere slip the mistake was made.

So, those who noticed the absence of the name of Henry Albers from the list of exhibitors last week, please bear in mind he was there with a fine exhibit.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE, CAL.

TREE FOR WIDE STREETS.

While at San Diego recently the writer noticed about one half of a city block planted with the Moreton Bay Chestnut (Ficus macrophylla) and they seemed to thrive in poor soil with a meagre supply of water.

We have throughout the state, a great number of these trees in ornamental grounds, but untried in many localities for street planting. The tree, when well supplied with water, will, in twenty-five years, grow to such a size as to completely arch a street of sixty feet in width. The trees at San Diego seem to have been planted eight or ten years and were not more than fifteen feet high, and the same diameter of top and, while looking well, evidently had been retarded in growth by a shortage of water.

* * *

TREES FOR ALKALI SOILS.

Editor Cultivator: Can you give me names of street trees that will stand the climate of Fresno county, where there is considerable alkali in the soil? —J. C. W.

The following will thrive on any soil in your section: Albizzia lophanta; Eucalyptus amygdalina–rostrata–viminalis; Koelrenteria paniculata; Platanus orinetalis. All may be found on sale at the nurseries in Fresno and vicinity.

* * *

RUBBER TREES.

A. C. R., San Diego, wishes to know if rubber trees can be grown in California.

The question is a broad one. We grow Ficus elastica, the Indian rubber tree, in many parts of Southern California. It may be possible the Mexican rubber tree, Castilla elastica, will also grow here but we have never seen the experiment tried, and as it requires an abundance of water, the chances are against its thriving in this climate.

* * *

THE PERGOLA.

A friend of the writer's, who has a keen appreciation of things beautiful in the garden, has "discovered" that the pergola exists in Los Angeles, both in its simplest form and "treated architecturally," and people are beginning to ask, "What is a pergola." Nothing harmful. In simple English it is simply a covered way or path. All that the writer has seen in the vicinity of Los Angeles are obtrusive and therefore obnoxious. A pergola should never be made except there is apparent use for it, and then, if near the dwelling, it should smack somewhat of the same style of architecture. In landscape gardening proper there is no place for it, but the more formal styles, especially the Italian, there is some excuse for it, often a use.

The simplest and best uses for pergolas are as dividing lines between the vegetable and the flower garden, or between two plats, planted in different styles—to hide unsightly objects; or they may be used effectively around tennis courts by leaving the side next the grounds unplanted. The best material to use, if removed from a plain and open view of the house, is the bodies of small trees cut so as to leave a fork at the proper height in which to lay the main cross beams. When close to dwellings of pretentious style the uprights may be either of turned or square columns of wood or piers made of brick, stone, or concrete, as the material and style of the residence may determine. If not kept properly covered with vines, all styles become unsightly.

The minimum weight of cured fruit for a carload is 30,000 pounds, and of fresh fruit 24,000 pounds. Pears are packed in 50-pound boxes, requiring 480 boxes to make a carload. It takes 1117 boxes of peaches for a car, as this fruit is packed in 21½-pound boxes. Plums and prunes are placed in 26-pound crates, 924 of them making a minimum carload. Apricots and grapes are figured at 25 pounds to the crate. Of oranges it takes 862 boxes to make a car and 312 boxes of lemons

HORTICULTURAL COMMISSIONERS IN STATE MEETING.

There was a meeting of State Associations of County Boards of Horticultural Commissioners with attendants from various counties of the state in the city of Fresno last week, which was a better example of what might be done than what was done. The commissioners have a meeting once each year, and at the same time and place as the State Fruit Growers' Convention. The meetings are not of an official nature, but more particularly a conference as to the various pests affecting horticultural or agricultural interests, how to keep them out of the various sections, laws on quarantine or insect control now insufficient, or needed laws which should be enacted and many other features are discussed.

Usually there have been several sessions of these meetings, but this year there was only one, as the time of the convention filled almost every hour of each day. Much was discussed but little threshed out and recommended.

There were present Quarantine Officer Alexander Craw, of San Francisco, Chairman A. D. Bishop, of Orange Co.; Secretary Harry P. Stabler, of Sutter Co.; Edw. M. Ehrhorn, Santa Clara Co.; S. R. Pease, San Bernardino Co.; O. E. Bremner, Sonoma Co.; C. H. Rogers, A. N. Judd and S. M. Fidel, Santa Cruz Co.; W. D. Weaver, Fresno; Mr. Byron, Kings Co.; Mr. Coats, Tehama Co.; Harvy C. Stiles, of Butte Co.; Wm. Weaver, Shasta Co.; Professors Woodworth and Clarke of the State University, Prof. A.J.Cook of Pomona College, Prof. Newton P. Pierce, Government Pathologist, of Santa Ana; Mr. Volck of the State University, and Mr. Messenger, of the Cultivator.

Reports were made by the various commissioners of conditions in their counties. On the subject of insect pests there was a most hopeful feeling. Between the natural enemies and the improved methods of spraying, reasonably satisfactory control is secured, though by no means extermination. Much enthusiasm was manifested regarding the Scutellista cyanea which promises to vastly reduce the black scale. But in the matter of fungoid diseases there is apparently a feeling of discouragement. The pear blight, walnut blight, California vine disease (Anaheim is trying to shunt off "Anaheim disease), and some others, still offer serious problems.

There were diverse opinions as to legislation. Some commissioners thought present laws sufficient; others that further enactments are necessary. One law, or a change in the present law, which called for discussion is that in regard to appointment of three commissioners. Prof. Cook, Mr. Pease and Mr. Ehrhorn favored its change so that there should be only one commissioner. Mr. Stabler and others decidedly opposed such change. The arguments advanced by those favoring the law are in short that one executive officer is more efficient than three. The appointment of three as now required by law, each drawing $4 per day salary, makes an unnecessary burden on tax payers which they will not tolerate, hence in some counties are never appointed. No one commissioner having full power, the best results often fail of accomplishment when three are responsible for action. One man of ability, appointed under civil service rules, with a good corps of inspectors, can accomplish more than three "politicians" who are appointed in payment for services rendered any political party.

Those in favor of the present system claim that three intelligent fruit men from different districts of the county may bring in reports of conditions in the various districts and by acting together secure much better results than any one man may. If county supervisors are dishonorable enough to pay political debts with such important offices they will secure means of evading another law. The securing of a new law with desirable features which may not be amended to features which may not be amended to death in the enactment is much easier

Professors Woodworth and Clarke both reported regarding experiments and observations in the Pajaro valley codling moth investigations.

As the next meeting will preceed the meeting of the state legislature, it is probable that more spirited arguments will be heard and possibly more definite results accomplished.

The United States quartermaster's department has called for proposals on what is said to be the largest orders for forage ever placed on the Pacific coast. The call is for 4320 tons of oats and 5435 tons of hay, the latter amounting to nearly 75,000 bales, all to go to the Philippines.

The monthly report of Los Angeles County Horticultural Commission for October shows that there were treated during the month 130,611 citrus trees for black scale, of which 116,635 were sprayed with distillate and 13,635 were fumigated. For red scale 1126 trees were sprayed with distillate and 725 were fumigated with gas. The salaries of commissioners and inspectors for the month amounted to $857.88.

California Vine Disease....

BY NEWTON B. PIERCE, SANTA ANA

Since the first appearance of the California Vine Disease in the vineyards of Anaheim, California, in 1884-85, it has never entirely ceased its ravages in the affected districts. Its spread through southern California was very rapid, so that within five years from its first appearance it had ruined at least twenty-five thousand acres of vines in what are now the counties of Orange, Los Angeles, San Bernardino, Riverside and San Diego. This involved a direct and indirect loss of not less than thirty million dollars.

About five years later, in 1889-90, the same disease broke out in the upper end of the Sacramento Valley, and old Mission vineyards both east and west of the Sacramento River, in Tehama county, died in a single season. Since that date extensive vineyards have been killed in Tehama, Butte, Colusa, Yuba and Sutter counties, and many others have been practically ruined. Probably five thousand acres of vines have been destroyed in that section of the state since the date named.

A third extensive viticultural center has more recently become affected by the same disease. About 1898-99 the great vineyards of the Santa Clara Valley began to fail in a manner similar to those of Southern California and those of Tehama County. The death of vines in the Santa Clara Valley has been rapid over large areas, while the east side of the valley and among the Santa Cruz Mountains at the west the destruction has been slower and is still progressing. The affected district includes portions of the counties of San Mateo, Santa Clara, Santa Cruz and Alameda. It is probable that the loss will amount to ten thousand acres of vines in this district, as nearly or quite that acreage is already affected.

We have then, in general summary, a destruction of forty thousand acres of vines by this disease in the course of the past twenty years—1884 to 1904—and a direct and indirect financial loss to the state and county from this cause of probably not less than forty million dollars.

In both southern California and the upper end of the Sacramento Valley the California Vine Disease has destroyed the vineyards wholly independent of the action of Phylloxera, which pest, so far as known at present, does not exist in either district. In the Santa Clara Valley, however, Phylloxera has been present for some years so that both diseases must be taken into account in considering the effects in that locality.

A broad study of the appearance and developement of the California Vine Disease in the three great viticultural districts now affected, reveals certain prominent facts that should be noted by those interested in vine growing.

(1) The disease is more apt to develop in a region where the vines have been weakened by some cause—such as the injury of the root system by drought or excessive moisture, or by sudden changes from one to the other.

(2) The disease when once established in an epidemic form remains in the affected region in an active state, destroying new vineyards set from healthy cuttings and showing all of the characteristics of generally distributed parasitic malady.

(3) There are striking differences in the susceptibility to this disease of different varieties and species of grapes, although in the heat of a first epidemic many varieties will die more rapidly or more generally than after the height of the epidemic has passed.

We gather from these general observations certain guiding facts. (a) Vineyards of unaffected districts should be carefully guarded against all weakening influences, as a radical change of moisture conditions, for the prevention of disease is always better than cure. (b) When the disease obtains a foothold its presence should not be ignored but its effects should be carefully studied with a view of determining the comparative resistance of the varieties and species of grapes already growing in the district. (c) In replanting, only the hardier types should be selected, and in case these vines are unsatisfactory in fruiting qualities the hardiest known root should be planted and top-grafted with the most resistant variety producing the type of fruit required.

At present the vine most resistant to the California Vine Disease and which is believed by most growers to be of Vitis vinifera origin, though this is still an open question, is the Lenoir. Upon its own roots this vine is almost completely resistant, and this is especially true of vines set after the heat of the first epidemic has passed. The raisin grape showing the greatest hardiness in the Malaga. One of the hardiest table grapes is the Tokay. Some of the more resistant wine grapes are the Feher Zagos, Black Malvoisie, Grenache and Herbemont.

The Lenoir vine has shown such great resistance to the disease that experiments were inaugurated by the United States Department of Agriculture to ascertain its value as a root upon which to graft the more susceptible varieties. Nearly four hundred acres of Lenoir vines have been planted and grafted to other varieties during the past seven or eight years, the work being done by leading viticulturists. The evidence to date is that the Lenoir root greatly aids a more susceptible top variety in resisting the disease, and in case the top graft is of a somewhat hardy variety the combined resistance has thus far proven satisfactory from the commercial standpoint. This work is still in progress, but it i believed that the results already obtained warrant the presentation of these facts to the growers.

A concluding word relative to the nature of resistance may not be inappropriate. Vines which are resistant to Phylloxera are not of necessity those which are free from that insect, but they are vines sufficiently hardy to withstand its attacks and still permit of successful viticulture. This is equally true respecting resistance of root and top in the presence of the California Vine Disease. The disease affects even the hardiest varieties, though they show various degrees of resistance to its action. Hence, as already stated, the most resistant top should be placed upon the hardiest known root in grafting against the malady.

TODAY.

A slab of chal·edony lay,
Upon John Ruskin's writing-desk
And on it, cut in careful script,
The word "Today."

Honored of all, a wondrous man,
And held a prophet in his way,
He let "Tomorrow" bide its time,
And used "Today."

Upon the tablet of the will
How good to write, the selfsame way,
Putting tomorrow's uses by,
The word "Today!"
—Harriet Prescott Spofford in St. Nicholas.

BACK TO GRAN'PA'S.

I'm goin' back down to gran'pa's.
I won't come back no more
To hear remarks about my feet
A muddyin' up the floor.
There's too much said about my clothes,
The scoldin's never done,
I'm goin' back down to gran'pa's,
Where a boy can have some fun.

I dug up half his garden
A-gittin' worms for bait;
He said he used to like it
When I laid abed so late;
He said that pie was good for boys
An' candy made 'em grow,
Ef I can't go back to gran'pa's,
I'll turn pirate fust you know.

He didn't make me comb my hair
But once or twice a week;
He wasn't' watchin' out fer words
I hadn't orter speak;
He told me stories 'bout the war,
An' Injuns shot out West.
Oh, I'm goin' back down to gran'pa's,
For he knows what boys like best.
—Unidentified.

A KISS OR A BLOW?

Did you ever read "Put Yourself in His Place?" It is one of the strongest and most impressive books ever written by Charles Reade, but the title alone contains a wealth of thought, especially for parents and guardians of children.

How seldom we stop to think of the feelings of a child and how a sharp "no" or a quick blow hurts the delicate, sensitive nature of a child.

The "Oh, mamma, mamma," of a child struck in anger is most pitiful to hear, for it reveals a shock to the mind and the heart that never can be effaced until the child heart becomes calloused and it does not take many blows to do this.

One half of the diseases of humanity are brought about through inhuman parents; parents who would cry out in indignation if an animal were ill treated.

Thousands suffer from injury to the delicate mechanism of the ear which in time renders them deaf or susceptible to catarrhal troubles, because of frequent sharp blows upon the ear as punishment for some trivial thing. If you doubt it, let a man box your ears and watch the effect, and then put yourself in the place of a child with the cartilage and nerves extremely tender with youth and think what their emotions must be.

I know a young man, the son of Christian parents, his late father a shining light in the church, who has since two years old suffered from hip disease, one limb withered and shortened by the punishment given by his father. The favorite punishment of his father for his children was a cat-o'-nine-tails. Do you wonder that this crippled boy with a beautiful face is a gambler, rogue and thief, although too capable in the trick of deceiving to be caught?

If you want to write lessons of deceit, falsehood and crime upon the hearts of your children, the very best way is to cut them in with the lash of a whip.

Your little boy or girl wants to go out and play; you are busy and a bit cross, the weather is really not fit for them to go, and you sharply answer, "no;" you give no reason; you take no notice of their restlessness and disappointment and they get into mischief; you are angry and reprimand them with a slap or a cuff on the ear; they see and feel the irritation in your mind and perhaps become still more restless until wrought up to a high pitch of anger you chastise them severely. Have you been made happier or they better? You would save time and temper had you have given your reason for the "no," kissed the little ones and set for them some pleasant task that would have made them happy and soothed your own unrest and irritability.

The child is trying to grow, to adjust its delicate nerves and tissues to fulfill its mission; it is learning to reason by its questioning; its pure soul is still untainted by the roughness and sin of the world until your heavy hand imprints the first lesson of the power of the strong over the weak, until you outrage and humiliate it and lead it to question even the unselfishness of parental love.

There are times when children must be punished for certain misdemeanors; it becomes really a necessity, but nine times out of ten someone else has been the one to instill disobedience into the child's mind, and he must be punished for the sins of another rather than self, but when this does become an absolute necessity do not punish in anger, and let your punishment be more in the form of a denial of some coveted pleasure. They will see the justice of this when they have had time to think, and the blood and brain have not been heated by blows.

Some say, "there are times when a child just has to be whipped," and who cling to the old theory, "spare the rod and spoil the child," but more children have had evil whipped into them than ever had it whipped out.

Go into the prisons, and out of the thousands of criminals you will probably not find fifty who can truthfully say they were never whipped severely by their parents or guardians while they were small.

Go into the reform schools, and what are some of them doing today to reform the poor creatures intrusted to their care? They put handcuffs upon young girls and boys, and tying them fast to make them helpless, whip them. Is this teaching the love, purity and gentler living?

If you do punish, be sure that punishment is not given upon circumstantial evidence. I know a woman who is past the meridian of life, who when a child idolized her father; but seared into her heart and brain over all the years are the lashes of a horsewhip given upon the bare skin, laid there by that father, and no love of after years ever obliterated those lashes, ever lessened the bitterness of them, made doubly humiliating because they were unjustly given for an offense never committed.

The pleasures of a child, its pains and disappointments, are as great to them, in proportion, as yours are to you. If only you would stop to think of this. You rebel when you long for something that fate denies you, or when something intervenes that you cannot take the coveted pleasure trip, and sometimes weep over it and grieve for days. The child whom you must deny similar things feels them in perhaps greater measure, because they have not the developed reasoning facilities that you possess.

One more plea for the children, and that is, politeness. There is no reason why you should not be as polite to your child as to your friend. You would thank the friend for the most simple favor granted; do you thank the child when it runs your countless errands? do you show a courteous interest in its little affairs of the day, or do you thrust it aside with a rude, "Oh, I'm busy; do not bother me so!"

Do you say "please, my son; or, my daughter, will you do such or such a thing for me?" or do you say, "go and do this or that for me at once."

Is there a smile and cheerful good morning for your children, or simple indifference or criticism should they be five minutes late?

Do you sarcastically criticise their dress, their hair, the amount they eat, or if anything is amiss do you wait until they are alone and gently call their attention to it? Every sarcastic word spoken in a family whether by child, parent, brother or sister is an entering wedge to quarrels and estrangement farther on. If thoughtlessly indulged in suppress it at once.

A family owes more of courtesy to its members than to any stranger, because they are of one blood and the tie should be unbreakable and the sweetest of all on earth.

Our children, the treasures most dear to us, should not be made to eat the corner piece of pie or the neck of the chicken, or sit in the most uncomfortable chair, because they are children. Of course there are times when it is their turn to sacrifice, but such things always demanded of them cultivates selfishness instead of respect and courtesy.

If any of our readers take exception to these ideas, we should be pleased to receive their criticism, if first they will put themselves in the place of the one whom they condemn and reason what their own feelings would be. We want honest opinions and convictions, and if we have erred in our conclusions we are ready to learn why and where.—Edith Hall, in Small Farmer.

BREADMAKING.

The making of good bread is a science and a fine art, and the way to make a perfect article is like the straight and narrow way to heaven in that here be few that find it, writes Mrs. F. L. Rose in Farmers' Sentinel.

There is no one thing upon which the health and comfort of the family depends so much as upon the quality of the bread. Dark, sour, heavy bread casts a gloom over the entire meal, and all the luxuries that can be piled upon the table can not compensate for it. It causes indigestion and makes those who eat it irritable, cranky, and sour. White, light, flaky, crisp bread will make any meal appetizing and will cover any amount of other culinary failures. Indeed, it is safe to pronounce any one a good cook who invariably has good bread, because bread making requires more good judgment than any other article of cookery.

It may seem like a simple process, but it is not what it seems, because it is a result which is contingent upon many causes—the class of flour, the kind and condition of the yeast, the various changes of temperature, the kneading and the baking are all important factors.

This is why no exact rule can ever be formulated for bread making. What appertains in one climate or season of the year may not be effective in another. Good rules and general directions for making it are helpful, but they can never be exact.

It is an acquired art and knowledge comes only by experience. There are so many details that require accurate observation and critical watching. The good cook knows there must be a certain amount of fermentation, but it must never pass a certain degree, else acetous or sour fermentation results, which is fatal to good bread.

To watch all these things, to keep it just warm enough and not too warm, to knead in just enough flour, to place in the oven in just the nick of time, and to bake just right, requires training and skill. Bread will not make itself, nor can one trust to luck, for good bread is by no means a product of carelessness. It needs continual watching from the time the yeast is started until the bread is packed away in the bread box. The temperature and the condition of the atmosphere must always be taken into consideration. There was an old Hoosier woman who had the reputation of being a good bread maker. She was watched, and it was discovered that after she had kneaded her bread and put it in a bread bowl, she put the bowl in her bed and covered it with her featherbed. Now this may not be considered just the nice thing to do, but the idea that the bread must be kept warm and free from draughts of air is the correct one.

Another woman who was attending a series of meetings molded her bread in the forenoon and let it rise light by the kitchen fire. Then she set it out in the shanty while he went to the afternoon session. When she returned to her home it had frozen some, but she warmed it and made it into loaves and then left it in a cold place while she went to the evening meeting. After her return from the session she warmed it again and baked it, getting it out of the oven about midnight; but

it is unnecessary to say that the product of her ingenuity was not all that could be desired. Good bread will not bear neglect and any one who makes it must be devoted to the business.

There are many kinds of bread, biscuit, and rolls, all desirable compounds and all within the grasp of one who will thoroughly master the underlying principle of breadmaking and take into consideration all the moods and tenses to which this fermented article is subject.

Any girl who expects to take upon herself the housework in a little home of her own will do well to make bread at mother's and under her watchful eye for a long time if she wishes to acquire skill and avoid a long chapter of bitter experiences.

There is no surer way of learning the business than by actual experiment with an old cook. A good cook book on bread, in which the details of bread making are minutely given, is of value, but there is only one way to secure this pearl of great price, and that is by devoting one's self to it and mastering it.

It is an achievement of which to be proud, and the great sisterhood of housekeepers are anxious to learn the secret. Any one who could produce an infallible rule for the making of bread would be hailed as the benefactor of the age and if money value were placed upon the recipe the inventor would soon have an independent fortune.

As it now stands, a perfect article of this household necessity requires skill, fine judgment, devotion to the cause, and all-round common sense, and these are unpurchasable commodities.

RECIPES

Eat Little, but Have That Little Good

Potato Salad. — Twelve potatoes boiled in their jackets, peeled and cut into small dice; the white of three hard-boiled eggs; two bunches of young onions, chopped very fine, salt and pepper to taste. If young onions are not available, winter ones may be used in same proportion. Make a dressing of two well-beaten eggs, a scant half-cup of vinegar, two tablespoonfuls of sugar and butter the size of a walnut, boiling all together until thick. When cold, thin with cream and stir well into the potatoes. Line a salad dish with lettuce leaves, pour into it the salad and garnish with the yolks of three hard-boiled eggs cut into slices and a few leaves of parsley.

* * *

Ham and Eggs.—If you want to cook ham and eggs the very best way, cut the ham nearly half an inch thick, boil it in plenty of water till barely cooked through, pour off the water and put the pan in a place just hot enough to brown the fat part of the ham slightly, but not hot enough to make smoke or to brown the lean meat much. When this is finished, remove the frying pan from the fire, take up the ham, pour off the fat into a cup, and wipe the pan until it shines like a mirror, without a speck on it. Then put in a spoonful of fat, break in the eggs and set the pan in a place not much hotter than boiling water; cover it and let the eggs cook as slowly as possible for four or five minutes, taking them up as soon as they can be lifted out. Put them around the ham but do not pour any of the fat on the dish. Serve with mashed potatoes.

* * *

Creamed Spinach. — Wash the spinach thoroughly, and put in a kettle with no water except the moisture that clings to the leaves. Cover and cook until very tender. Drain and chop very, very fine, then whip light with a tablespoonful of butter and three tablespoonfuls of cream. Beat until you have a soft green mass, return to the saucepan, season to taste, stir steadily until very hot and serve on a hot platter garnished with triangles of thin, dry toast.

* * *

Hot Chocolate Sauce, with Arrowroot, for Ice Cream—Put into a saucepan one cupful of water, one-half cupful of sugar, one-half inch piece of stick cinnamon and one ounce or square of chocolate melted over hot water and mixed with one-half cupful of milk. When boiling, thicken with one tablespoonful of arrowroot wet in one-quarter of a cupful of water. Stir as it thickens and cook about five minutes. Remove the cinnamon, add one teaspoonful or vanilla, a little salt and serve it hot. Pour a small portion over each slice of ice cream.

ONLY A LITTLE WAY OFF.

"O mama! this seems 'like Christmas," called my little daughter from the window, where she stood watching with delighted eyes and face all aglow the first light snow shower of the season. And while Christmas is several days away, preparations for its proper observance by giving "good gifts" are at high tide. Actuated by the true spirit of giving, giving because we love to give, and putting into our work only loving thoughts, "Christmas work" is the most enjoyable our hands find to do. But if we plan to give from a sense of duty or because we know others will send gifts to us for which we feel we must send in return, we have no true enjoyment in it. I have never yet given anything from such a spirit, and hope I never shall. I am not often able to "make pretty things" of my own handiwork for Christmas giving, but every gift I send goes only as a loving remembrance—I could not enjoy giving otherwise. I am happy in the giving, and I am sure those to whom my small gifts go will be made happy by receiving them, for we all love to be remembered at the blessed Christmas time—the time of God's best gift to men.—Mother Bunch.

WHEN VICTORIA WAS A BABY.

The playthings of the late Queen Victoria, while in their splendor and intrinsic value will not compare with the almost priceless Jubilee presents that will be shown at the World's' Fari, will appeal to the sentiment of all who view them.

The British pavilion at the World's Fair will appeal to the sentiment of Kensington Palace, the birthplace of Queen Victoria. When she was a child she passed many hours in the quaint old building that was designed more than 200 years ago for Queen Anne, another of Britain's famed rulers. It was here that Victoria played with dolls and other toys that delighted the children of all classes.

When Mr. C. B. Wood, the superintendent of construction for the British building, was making his plans he visited the Orangery and faithfully copied all of the peculiarities. It was on these visits that he saw the toys with which the child who was destined to become Britain's best beloved ruler beguiled her time. Some of the dolls bore the marks of the love that the little princess had for her then favorite subjects. The paint is rubbed from the face of one. The arm of another is gone, and the leg of still another is missing. All of these toys are carefully preserved, and they remain just as they were when Victoria as the child cast them aside.

CLIMATE AS A HEALTH RESTORER.

In the current number of the California Medical Journal, Dr. J. A. Munk, of Los Angeles, discusses the effect of climate conditions on health. From a scientific view altitude is the thermometer which gauges the nervous condition of the body, and special attention should be given it when making a change with a view of benefitting health.

"Persons of nervous organizations," says the writer, "fare best at a low altitude, while phlegmatic temperment thrives on elevation." A patient who has organic disease should never seek a high altitude. Change of location is also recomended as beneficial to invalids. The climate of California, which is varied in its conditions, furnishes climatic altitudes to correspond with the needs of most people afflicted with nervous troubles.

The agitation for the promotion of silk culture is by no means confined to California. On the contrary, the work of our enthusiasts is a mere drop in the bucket—not sufficient, in fact, to attract attention outside of this State. The real strength of the movement lies in the Southern States, especially in Georgia, where the motive is to supply profitable work on farms for the negro women and children.

SCRUBBING FLOORS AND BATHING.

Scrubs the floors every day! Well, I just can't, for there's so much else to do, what with the baking, washing, ironing, mending, sewing and getting meals three times a day, I cannot find time for so much scrubbing as that. I try to clean the floors thoroughly twice a week, but we can live comfortbaly if it isn't done but once a week. I heard a young girl say, who is very particular about personal cleanliness and takes a bath every morning, that some people were so neat they cleaned their floors more often than they did their bodies, when it is so much more necessary, if we would be really cleanly and healthy, to bathe more often than we scrub. And that is what we do at our house. As I said before, my floor isn't always cleaned twice a week, but I see that every member of the family bathes at least that often, with a foot bath every night. And we are all hearty and healthy and happy. —K. Lean.

San Francisco Markets.

Dairy.

San Francisco, Dec. 9, 1903.

San Francisco, Dec. 16, 1903.

Under the influence of liberal supplies and the cautious operations of buyers, the general market for Butter continued on an easy basis most of the week. Holdings of the medium and lower grades of Butter have been heavy, and sellers unable to force sales, although willing to accept marked concessions.

BUTTER—Per lb:

Eastern Creamery	23 @25
Store	18 @20
California, storage	24 @27
Creamery, good to fancy	25 @27
Dairy, extras,	23 @24
Dairy, choice	21 @22
Store	18 @20

Eggs and Poultry.

Supplies of Eggs have been heavier and the market displayed an easier under tone. For fine selected Ranch the maximum quotation is still demanded in small ways.

EGGS—Per doz:

Ranch, selected, large	52
Ranch, good to choice	45 @50
Store	Nominal
California storage	28 @32½
Eastern	25 @30

The poultry market has somewhat recouped from the over stocked condition of last week. Dealers are beginning to stock up for the coming holiday trade, and fearing that the raging storms in the Middle West will curtail receipts of Eastern, operated with considerable freedom and readily paid full figures for top-quality Fowls.

POULTRY—Old Roosters, per doz., $4.50@5.50; young Roosters, $5@6; Fryers, $4@4.50; Broilers, large, $4@4.50; small, $3@3.50; Hens, small, $4.50@5.50; large, $6@7; Ducks, per doz., old, $5.50@6.50; young, $6.50@7.50; Live Turkeys, per lb., 20@22c; Dressed Turkeys, per lb., 21@24c; Geese, per pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz, old, $1@1.25; Squabs, $2@2.25.

Fruits and Vegetables.

Since the beginning of the week general trading in Fruits has been of fair volume, and some good-sized transactions in top-quality offerings have been closed at full quotations. Wednesday's business in citrus fruits was moderately active in most lines, and the appearing prices were maintained with a marked degree of steadiness.

DECIDUOUS FRUITS.—Apples, per box, common, 40@65c; choice to fancy, 75@$1; extras, $1.25@1.50; Spitzenbergs, $1.75@2; Lady apples, $1.25@2.

Pears—Per box, Winter Nellis, $1.50@2.

Persimmons—Per box, 50c@$1.

Quinces—Per box, 40@50c.

Table Grapes—Per small box, 50@65c; crate, 90@$1; large box, $1@1.50.

BERRIES—Per chest: Strawberries, Longworth, $8@12; large varieties, $3@4, as to quality; raspberries, $5@7; cranberries, per bbl., Eastern, $12@13; Oregon, per box, $2.50@$3.50.

CITRUS FRUITS—Per box: Oranges, new crop navels, $1@2.50; seedling, 75c@$1; Late Valencias, nominal; lemons, $1@2.50; extra, $3; grape fruit, $1.50@2.50; tangerines, 75@1.50; Japanese Mandarins, $1.25@1.75; limes, $4@4.50.

Under heavy supplies and a sluggish outward movement, the week's market for Potatoes developed a marked undertone of easiness, and the prevailing prices were unsteady and in buyers' favor.

POTATOES—Per ctl: River Burbanks, 75c@85c; Early Rose, nominal; River Reds, 60@75c; Salinas Burbanks, $1.25@1.45; Oregon Burbanks, 85c@$1.05; Sweet Potatoes, $1.@1.15.

VEGETABLES—Tomatoes, per box, Bay, 40c@75c; do, southern, per crate, $1@1.25; Green Peppers, per lb., 8@10c; Dried Peppers, Stockton, 5@8; southern, 11@12c; String Beans, southern, per lb., 8@10c; Wax, 8@10c; Green Peas, southern, per lb., 4@6c; Egg Plant, southern, per lb., 6@8c; southern Summer Squash, per box, $1@1.25; Cucumbers, per box, --; Mushrooms, per lb., 15@25c; Garlic, per lb., 6@7c; Dry Okra, per lb., 12½c; Marrowfat and Hubbard Squash, jobbing at ½@¾c per lb.

Dried Fruits, Nuts, Etc.

Aside from a moderately active inquiry for Prunes and Apricots from European centers the local market for Dried Fruits is featureless and of tame appearance, but with holders indifferent sellers, prices are maintained with marked steadiness.

DRIED FRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 4½@6c; Sun Dried, 3¼@4c.

Apricots—Royal, fancy, 9@10c, choice, 7½c@8½c; Moorparks, choice, 9½@12c.

Peaches—Choice, 5¼@6c; fancy, 6¼@7c; peeled, in bxs, 11@14c.

Pears—Choice, 7½@8½c; fancy, 9c.

Plums—Pitted, 6¾9c; unpitted, 1@1½c

Prunes—Four sizes, 60s to 100s, 2¾@3c for Santa Clara; other sections, ¼@½c less

Nectarines—White, 4@5½c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1903 crop, f. o. b. at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.35; Two-Crown London Layers, $1.25; Muscatels, Four-Crown Standard, loose, 6½c per lb; do, Three-Crown, 5⅝c; do, Two-Crown, 5¼c, Seedless Muscatels, 4¼c; Seedless Muscatels, floated, 4½c; Seedless Standard Sultanas, 4¼c; Thompson Seedless, Standard Sultanas, lencias, Standards, 4¼c; do, Pacifics, 3⅝c; Orientals, 2¾c; Malagas, Three-Crown, 5⅝c; do, Two-Crown, 5c.

Seeded Raisins—Prices for limited quantities are as follows: Fancy, 16 oz, per lb, 8c; choice, 7⅝c; fancy, 12 oz, per pkg, 6⅝c.

NUTS—Per lb: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Peanuts, Eastern, 6@6½c; California, Walnuts, soft shells, No. 1, 13@14c; do, No. 2, 11@12c; hard shell, No. 1, 12@13c; do, No. 2, 10@11c.

HONEY—New Comb, per lb, White, 12@14c; Amber, 10@12c; Extracted Water White, 5½c@6c; Light Amber, 5@5½c; Dark Amber, 4½@5c.

Beans.

There is a lull in the demand for Beans and operators generally report the market in the same quiet position usual at this season of the year. Under light offerings, prices are unchanged, and are regarded as largely nominal in character.

BEANS—Price per ctl: Large Whites, $2.35@$2.35@2.65; small, do, $2.90@3.10; Pea, $3@3.10, Lima, $3; Red, $3@3.15; Pink, $2.40@2.65; Bayo, $2.15@2.25; Blackeyes, $2@2.25; Red Kidneys, $4.25@4.50.

DRIED PEAS—Green, $2.50; Niles, $2.75

Live Stock.

CATTLE—No. 1 Native Steers, 8@8½c: second quality, 7½@8c; thin Steers, 6½@7c; No. 1 Cows and Heifers, 6½c; second quality, 5½@6c; thin Cows and Heifers, 4@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½c @4c, gross weight; Ewes, No. 1, 3¼@3¾c; gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb, live weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs and over, 5⅜@5½c; weighing under 130 lbs, 5@5¼c; weighing 260 to 350 lbs, 5@5¼c; rough heavy, 4@4½c.

FRESH MEAT.

BEEF—Per lb: No. 1 Steers, 7@7¼c; do, second quality, 6½@6¾c; No. 1 heavy, 7@7¼c; thin, 5@5½c; No. 1 Cows and Heifers, 5½@6c; second quality, 5½@6c; thin, 3½@4½c

VEAL—Per lb: Heavy, 7@7½c; medium, 7½@8c; light, 8½@9½c; poor Calves, 6@7c.

MUTTON—Per lb: Light Wethers, 8@8½c; do, Ewes, 7½@8c; heavy Wethers, 7½@8c; Ewes, 6½@7c.

SPRING LAMBS—Per lb, 8½@9½c.

DRESSED HOGS—Per lb, 8@8½c.

Hay and Feed Stuffs.

HAY—Prices on Hay, per ton: Wheat, $13.50@16.50; Wheat and Oat, $13@15.50; Oat, $11@15; Barley, 9.50@13; Clover, $10.50@11.50; Alfalfa, $9.50@11.50; Stock, $8.50@10.

FEED CORN MEAL—Choice grades, per ton, $28.50@$29.

MIDDLINGS—Per ton, $26.50@28.

BRAN—Per ton, $19.50.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

BRAN—Per ton, $21@22.

FEED CORN MEAL—Choice grades, per ton, $29.50@30.50.

BRAN—Per ton, $19.50@20.

COCOANUT CAKE—In lots of ten tons, $21; 5 tons, $21.50; less quantity, $22. Prices are mill rates and are subject to change without notice.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@4.85 per bbl; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—No. 1 shipping, per ctl., $1.35@$1.37½; white milling, good to choice, $1.40@$1.50.

BARLEY—Choice No. 1 feed, $1.11¼@$1.15; off grades, $107½@108¾; brewing, No. 1, $1.17½@$1.22¼; Chevalier, $1.30@1.45.

CRACKED CORN—Choice quality, per ton, $29@$30.

OATS—Good to choice white, $1.22@1.35.

Hops.

The price for new crop is 18@22c per lb., according to quality.

WOOL.

Fall clip, per lb: California Plains, 6@8c; Foothills, 8@10c; Middle Country, 10c@12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

Chicago, Dec. 16, 1903.

The demand for May wheat was strengthened this week by the cable reports of continued heavy rains in Argentina. Wednesday cash quotations were as follows: Flour was dull and prices off 5@10c; No. 3 spring wheat, 78@79; No. 2 red, 80⅝@84¼; No. 2 corn, 42½; No. 2 yellow, 44; No. 2 oats, 35⅛@35⅝; No. 3 white, 36@37¼; No. 2 rye, 52; good feeding barley, 35; fair to choice malting, 45@53; No. 1 flax seed, 93; No. 1 Northwestern, 1.00; prime timothy seed, 2.85; mess pork, per bbl., 11.25@11.50; lard, per 100 lbs., 6.32½@6.35; short ribs, sides (loose), 6.00@6.25; short clear sides (boxed), 6.25@6.37½; clover, contract grade 11.00.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	41,600	18,700
Wheat, bushels	150,800	45,700
Corn, "	180,900	39,100
Oats, "	214,300	125,900

Barley, "	80,700	13,800

Chicago Live Stock.

CHICAGO, Dec. 16.—Cattle—Receipts, 24,000; lower and weaker; good to prime steers, 4.90@5.75; poor to medium, 3.00@4.75; stockers and feeders, 1.75@3.90; cows, 1.50@2.30; heifers, 1.75@4.50; canners, 1.50@2.30; bulls, 1.75@4.00; calves, 2.00@5.25. Hogs—Receipts, today, 6000; tomorrow, 45,000; 10c lower; mixed and butchers, 4.35@5.60; good to choice heavy, 4.45@4.55; rough heavy, 4.25@4.40; light, 4.15@4.45; bulk of sales, 4.35@4.45. Sheep—Receipts, 25,000; choice wethers, 3.50 @4.00; fair to choice mixed, 2.50@3.40; western sheep, 3.00@4.00; native lambs, 4.00@6.00; western lambs, 4.50@6.00.

California Dried Fruits.

NEW YORK, Dec. 16.—The market for evaporated apples shows a better demand. Prices are quoted at 4@5 for common; prime, 5¼@5½; fancy, 7. Prunes show a slightly improved tone, with holders looking for an increased demand after the holidays. Quotations ranged from 3⅝@6½ for sizes ranging from 90-100 to 40-50s. Apricots ruled firm, with a fair jobbing demand reported. Choice are quoted at 9¼ to 9½; extra choice, 9¾@10¼; fancy, 11@15. Peaches are quiet, but steady, with choice quoted at 7¼@7⅝; extra choice, 7¾@8¼, and fancy at 9¼@10¼.

CITRUS MARKETS

THE ORANGE MARKET.

The orange market in general is in a little better condition, there being a greater demand on account of nearness to holidays and dealers purchasing their supplies. The auction markets are paying fair prices on strictly fancy high colored stock, of which, however, there is but a very small proportion in the Northern Californias arriving. Too much of it shows poor color, greeness, etc. Nearly every car contains all or a heavy proportion of 80s to 126s.

Western markets show fair demand for everything in the shape of cars of desirable sizes. There is an overstock of large sizes, of which but a limited quantity can be used in the smaller western point.

The southeastern section is not open to California oranges, as there is no through rate of $1.25 east of the Mississippi and south of the Ohio, with the exception of points on the coast, where shipments can be made as far south as Virginia points.

The market on seedling has dragged very heavily, but there is a slightly better feeling on these on account of the auction markets taking them this week at a little better prices than could be gotten at western points.

THE LEMON MARKET.

The Lemon Market.—The lemon market has collapsed; there is no demand, and consequently no price of a satisfactory nature. Low grade and off size stock will hardly bring charges. The very satisfactory prices received for lemons up to a month ago probably induced heavier shipments of foreigns than would have been made under different conditions, and we are at present feeling the effects of them, as well as quite liberal shipments from California.

AUCTIONS.

NEW YORK, DEC. 10, 1903.

T. C. Porterville, Forget-me-not Navels $2.05. Oakleaf $1.80, 5% decay, pale and green.

PHILADELPHIA, DEC. 15, 1903.

C. C. U. Palermo Yule Tide Navels $2.30.

C. C. U. Exeter, Monarch Navels $1.85, greenish and spotted.

NEW YORK, DEC 15, 1903.

10,000 boxes Sicily lemons, Steamship Robinia were sold today. The condition of the cargo was good. The market is firm on 360s and weak on 300s. Fancy 300s sold for $2.25 to $2.00. Seconds $1.85 to $1.70. Fancy 360s sold for $2.25 to $2.15. Seconds $2.10 to $2.00.

There are on hand and available for sale within the next thirty days 103,000 boxes of Sicily lemons as against 77,000 boxes at this time last year. The next sale will be on Thursday, at which 18,000 boxes will be offered.

Total shipments from California this season 957 cars, of which 264 are lemons.

Total to same date last season 1462 cars, of which 288 were lemons.

FARMER'S INSTITUTE.

There will occur two Farmers' institutes during the holidays: Pasadena Dec. 28-29 and Glendora 30-31, closing the year. A good program is being arranged and a profitable season is assured. Let all from the localities and surrounding neighborhood be present to enjoy the good feast.

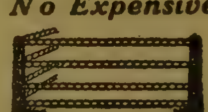
No Expensive Special Tools



are required to erect the

Truss and Cable Fence

Many field or netting fences require considerable skill and expensive machinery to put them up, while with ours neither is necessary. A novice can erect a truss and cable fence as well as an expert can the other kind and can put up a hundred yards in about half the time. We have a simple and inexpensive stretcher that is made to facilitate the handling of truss and cable wire but it is not necessary as any other stretcher may be used.

100 OUTFITS IN USE PROVE PRACTICABILITY

Saving of full one-half spraying labor bill shows economy. Scale, moss, worms and blight on trees and vines show necessity. In other words —what you need we can supply in a practical way, and save you money. Ask us where you can see a machine.

BEAN SPRAY PUMP CO., Santa Clara St., San Jose

FILL THE EGG BASKET

The Foundation of Success in Poultry Raising

Eggs are the foundation of success in poultry raising. If you do not get eggs you will not make money, and no matter whether you keep poultry for pleasure or profit, results are what you want.

SUCCESS FROM ATTENTION.

Eggs are not a matter of luck. Hens do not "just happen" to lay or "just happen" not to lay, as some think; but success in poultry raising, the same as in any other business, depends mainly upon the intelligent attention paid to details.

THE FEEDING PROBLEM.

Now, every man or woman who raises poultry knows that of the many things requiring constant attention, nothing is more important than the feeding question. Fowls must not only have plenty of feed, but it must be of the right kind or they will not thrive and prosper; and unless they do there is failure in store for the poultry raiser.

POULTRY FOOD.

As for food, the Dairymen have learned how to feed for milk and butter, the Stockman for quick growth of meat and Poultrymen for eggs on one hand and meat on the other.

THE HEN AS A MACHINE.

In many ways we regard the hen as a machine for converting raw material into eggs and flesh, and she, like any other machine, must have proper materials for her work, for she cannot manufacture eggs unless you give her something to make them with.

AN EGG NOT A SIMPLE MATTER.

As you no doubt know, an egg is not a simple matter, but is composed of a variety of substances. We know that within the shell is everything required for the formation of the chick:—bone, muscle, tissue, blood, feather, etc., this being the case you can readily realize that a variety of substances is needed to make the egg, and as the hen gets them from the food she eats it stands to reason that unless this food is of the proper character, viz: containing all the egg forming materials in the correct proportions, she will not lay, or at least not to her fullest capacity.

A chick cannot grow or a hen cannot lay unless you give them the proper materials with which to make bone, muscle and eggs.

THAT'S PLAIN.

We know how to make good Poultry Food and we do it. Coulson's Egg Food, a balanced ration, ready mixed feed that makes hens lay.

In order to get the best results from your laying hens, it is necessary that you feed them a warm mash of Coulson's Egg Food. Profits from poultry depends on how and what you feed. When hens do not lay well or at all many owners think if they look rosy, plump and fat that is an indication that they surely receive ample supplies of proper food. But there is a science in feeding. Laying hens should be fed food that makes egg production and at the same time strengthens the hen.

In order to get best results from laying hens you should feed them Coulson's Egg Food, which is for sale at almost all feed stores. Get a ton, give it a trial and make more money out of your hens.

Loading Cars With Coulson's Egg Food

Fallon, Marin county, November 10.

Mr. A. R. Coulson, Petaluma—Dear sir: My chickens were dying of cholera at the rate of 7 to 10 per day until I had lost about 400 hens. On or about August 1st your Mr. Miles called upon me and I purchased 50 pounds of your No. 3 Condition Powder and 1 bottle of Cholera Cure. I fed the hens 1 half left—about 700—7 tea cups full of No. 3 powder every morning in the mash, also put the Coulson's Cholera Cure in the drinking water according to directions, and sprayed the houses every day with a solution of crude carbolic acid and Coulson's Phenylene in the proportion of 1 gallon acid to 5 gallons of Phenylene, and I wish to say that, from the time I started to use your goods up to the present time I have not lost more than 20 hens.

And I also noticed that they were backward on the molt, but now the new plumage is coming on very fast and they look fine. I am perfectly satisfied and consider that your remedies helped me in more ways than one, for besides CHECKING and CURING the cholera they also materially helped the molt, and I can cheerfully recommend them to the poultrymen. Yours truly, James Fallon.

This recommendation comes from a locality where more than six thousand hens have died from cholera in the past three months, some poultrymen losing from four hundred to two thousand hens.

Here is another recommendation for Coulson's No. 3 Condition Powders:

A. R. Coulson Co., Petaluma—Gentlemen: My hens of which I have 1400 were dying at the rate of four hens a week. I purchased 50 pounds of Coulson's No. 3 Condition Powders last August. I put a little in their feed every morning and have not lost over six hens since. It is the best condition powder for poultry that I ever used and I can recommend it to all poultrymen. J. W. Dotters, Novato, California.

Antioch, Calif., Dec. 2, 1903.

The A. R. Coulson Co., Petaluma—Gentlemen: I have been using Coulson's Balanced Ration Egg Food for about six months and will say that my flock of birds, consisting of Barred Rocks, White Minorcas and Pekin Ducks (numbering about 450 birds) are looking better and have molted earlier than ever before, and furthermore, my old hens started to lay in November, two months earlier than ever before.

I am perfectly satisfied with your feed, for it does all you claim for it, and I can cheerfully recommend it to all poultrymen.

Wishing you success, I remain, Yours respectfully, Willis S. Rose.

P. S.--One pen of these Pekin Ducks took first prize at the San Francisco Show, Dec. 1-5, 1904.

Santa Maria, Cal., Nov. 25, 1903.

A. R. Coulson Co., Petaluma, Cal.

Dear Sir: I have used five sacks of your egg and feather food, feeding it to my hens during the molting season, and they kept on laying better than they ever did before during that period.

I can heartily recommend your egg food to any poultry raiser and it will do all that is claimed for it. J. R. Triplett.

CHICK FOOD.

If you like to see little chicks dive into the feed as though they like it; if you want to see little chicks always spry and healthy; if you want to have them grow rapidly and mature quickly; then you want to feed them the first two months on

COULSON'S CHICK FOOD

and you will be pleased with the way your little chicks are growing. No bowel trouble, no leg weakness on

COULSON'S GROWING CHICK FOOD.

Coulson's Chick Food will cost you more than some other feeds, but Coulson's Chick Food will raise the finest and largest chicks.

We take great pains and carefulness in selecting the grains, seeds and meals to be used in preparing the Food.

More than 200,000 pounds of the chick food sold last season and about a million chicks were fed on the Food.

Already this season we are receiving orders from dealers for thirty thousand carload lots. On one ranch near Petaluma of O. H. Puryine there is at the present time a flock of three thousand two hundred little chicks that are fed one ninety-pound sack a day of the Food, and the owner says he never had a flock of little chicks that eat and grow like these do.

Coulson's Food is the feed that little chicks like and it is the feed that makes little chicks grow.

If you are going to raise any chicks, give it a trial and you will be well pleased how nice your little chicks will be and how they will grow.

FRIENDLY INSECTS....

By Deputy State Horticultural Commissioner Alexander Craw.

When Californians first suggested the idea of controlling the injurious insect pests of our orchards by the aid of beneficial or friendly insects, some of the prominent entomologists of the country ridiculed the proposition and one even advanced the statement that few pests meant few parasites. Certainly, if there were only few injurious insects, they could hardly be considered pests, and few parasites would be required to keep them in subjection. It is now a well recognized fact that injurious insects are those that have no parasites to keep in check their excessive increase.

Insects that live at the expense of growing plants, trees or shrubs must be considered injurious and the greater their numbers the more destructive will their presence be to the trees attacked. Some injurious insects are more or less restricted in their food habits or tastes and again others attack a great variety of plant life and on this account are difficult to control by artificial methods, such as poisons, sprays or fumigators. In the great majority of cases the latter method is the most effective, as it is far reaching and deadly, if sufficient chemicals of the proper strength are used and the tents or fumigating rooms are gas tight.

* * *

Artificial methods have in no instance exterminated or even prevented the spread of insect pests when once established in a district. Of course their too rapid increase and spread has been checked to greater or less extent by such remedies and it would be the height of folly to await the advent or introduction of a parasite or beneficial insect to destroy a pest, when it can be destroyed in great numbers by either spraying or fumigation. Extermination is out of the question with either method and the work has to be repeated at least once a year, and in the case of certain insects, from two to six sprayings are necessary in order to save the crop (as with apples and pears) from destruction by the codling moth. No member of the late Board of Horticulture, or the Commissioner of Horticulture, or any one connected with his department, has ever advocated the laisser faire or "let alone policy" with respect to the control of injurious insects for which we have no parasite or predacious insect enemy. On the contrary, numerous bulletins have been issued by this department giving directions in the methods of spraying and fumigating orchards. It was only after very heavy loss and expensive experience that we determined to try nature's method and introduce the insects that keep such pests under control in their native country.

It has been claimed that the same insects have always been in existence and the same fruits have been cultivated in the old world for centuries and we have no reason to become alarmed, but in those countries they were content to propagate and grow the same varieties their grandfathers grew, and there was little danger of introducing new pests. The bright and thrifty condition of the trees induced our pioneers of the fifties and sixties to bring or send for new varieties. The "soft brown scale" (Lecanium hesperidum) was introduced into the orchards and gardens of Los Angeles and spread with alarming rapidity. The parasites of this scale are both chalcid flies. One, Coccophagus lecanni is parasitic of the small scales and the other, Encyrtus flavus, attacks the full grown scale.

* * *

The next serious scale that was introduced was the "black scale," Lecanium oleae. This is a more general feeder and besides olive trees it also attacks orange, lemon, lime, plum, peach, apricot, pepper, oleander, crataegus, pittisporum, abutilon, pelargonium, photinias and a variety of wild shrubs and weeds. We have a native internal parasite, Tomocera californica, that in some seasons destroys from twenty-five to seventy-five per cent, but as each scale produces from 1500 to 2500 eggs, it will be readily seen that the parasite alone could not cope with such a pest, as it has but one generation each year. Another internal parasite is Aphelinus mytilaspidis, a more slender species, but not so prolific. The "black lady-bird", Rhizobius ventralis, was introduced from Australia by Dr. Albert Koebele, when collecting beneficial insects for the State Board of Horticulture of California. Twenty of these valuable beetles reached us alive, and they have been of great service in cleaning out the black scale in the coast regions. In the southwestern portion of Alameda county, Wm. Barry, horticultural commissioner of that portion of the county, made a canvas in Washington township of the orchardists having five acres and over, and learned that since the introduction of this beneficial insect nine years ago, they have saved over $171,000 for disinfection. The Rhizobius ventralis breeds the year round and destroys the eggs, larvae and adult "black scale." Unfortunately they do not appear to thrive away from the sea breezes. At Ellwood, in Santa Barbara county, Mr. Cooper, before the introduction of this lady-bird, spent from $3000 to $5000 per annum in spraying his orchards with kerosene emulsion. Since then he has relied upon the lady-birds and his trees bear better and cleaner olives.

* * *

The next serious pest introduced was the "cottony cushion scale," Icerya purchasi. This come on trees brought into Menlo Park from Australia in 1868 and in the eighties it had spread over a great portion of the state and it was such a destructive insect that the orange industry was threatened. The expensive fight made against this pest in California with sprays, fumigators, etc., resulted in more advance in the study of economic entomology than any other one thing and was the cause of our belief that nature had a more efficient and cheaper remedy where the scale was a native, than our artificial appliances.

Mr. Albert Koebele of Alameda, an attache of the Department of Agriculture of the United States, was selected to go to Australia and he discovered and sent us the Vedalia cardinalis, a lady-bird that was hardly known by the entomologists of its native country. Since then the State Board of Horticulture has taken the precaution to keep a stock of this valuable lady-bird under artificial propagation, or rather their propagation in confinement in the San Francisco office. When sending colonies of Vedalia within the state, we request the applicants to send us a box of scale infested twigs at our expense. In this way we secure food for our colonies in our breeding jars. Besides the Vedalia, we have three other Australian lady-birds that prey upon this scale alone, viz., Novius koebelei, Novius bellus, and "black Vedalia." We have also two internal parasite flies, Lestophonus iceryae, and Ophelosa crawfordi. With such a list of active workers you can readily understand that the "cottony cushion scale" has a hard struggle for existence in California.

Another foreign pest that has done serious injury to orange and lemon groves is the "yellow scale," Aspidiotus citrinus. Mr. L. J. Rose of San Gabriel, purchased a small Japanese orange tree and planted it on his Sunny Slope estate. The existence of scale was overlooked at the time. The scale spread to other orange trees in the vicinity and soon after the celebrated avenue of four rows of grand old trees appeared to be hopelessly ruined.

You all remember the hard fought battle that was waged against the so-called "San Jose scale," Aspidiotus perniciosus. Although it has a local name, it is nevertheless of foreign origin, and according to Professor C. L. Marlatt, it is a native of China. The late James Lick, of San Jose, was a great lover of and experimenter with trees and plants from other countries, and it is claimed this scale was first observed in his orchard. The "San Jose Scale" is not plentiful now in California owing to an internal parasite, Aphelinus fuscipennis, assisted by the "twice stabbed lady-bird," Chilocorus bivulnerus, and Rhizobius toowoombae.

The "brown apricot scale," Lecanium armeniacum, was a very filthy pest on prunes, apricots, peaches and plum trees, owing to the great amount of honey dew exuded by the insects. The leaves and fruit were consequently badly attacked by smut. Since its parasite,Comys fusca, became established in infested orchards, it is not so troublesome.

* * *

Twenty years ago, the large green "Katydid" did much damage to the blossom twigs of orange trees in the southern counties. It is very rare now owing to a very interesting parasite that attacks its eggs. This parasite, Eupelmus mirabilis, lays but a single egg in each Katydid egg. The latter is very flat and the mature parasite has the same character of body. Numerous other friendly insects could be mentioned but a brief review of what has been accomplished by the Southern African parasite of the "black scale," Scutellista cyanea, will be interesting. This parasite was introduced through the kindness of Prof. Chas. P. Lounsbury, Govt. Entomologist of Cape Colony, two years ago. Several colonies were sent by Prof. Lounsbury to Mr. E. M. Ehrhorn, Horticultural Commissioner and Entomologist of Santa Clara county. He bred a colony in confinement but did not succeed in establishing them out of doors. On october 1st, 1901, Prof. Lounsbury wrote me that he would send me on the following day, two boxes cantaining parasites. The packages took thirty days to reach us and we bred 17 Scutellista cyanea, and a few secondary parasites; the latter we destroyed. Only four of the true parasites were females and unfortunately one of these was killed by a small spider, leaving but three with which to stock the state. On February 17th, 1902, the Scutellista began to issue from the scales and the descendents of those three have increased to millions and wonderful work has been accomplished by them in this short time. During July I made an extended tour of the southern counties and reported my observations of the work of the Scutellista to State Commissioner of Horticulture Cooper. Since then we have had most encouraging reports from County Horticultural Commissioners, orchardists and others, showing that the good work still continues.

* * *

SUBSCRIPTION RATES

One dollar per annum in advance. To foreign countries within the Postal Union, one dollar and fifty cents per annum in advance.

Responsible subscribers will continue to receive this journal until the publishers are notified by letter to discontinue, when all arrearages must be paid.

When ordering a change in address, subscribers should be sure to give their former as well as their present address, in order to insure desired change.

Date on wrapper or on address slip shows time paid to, thus: John Smith, 1-04, means subscription is paid to January, 1904

Entered at post office at Los Angeles, Cal., as second class matter.

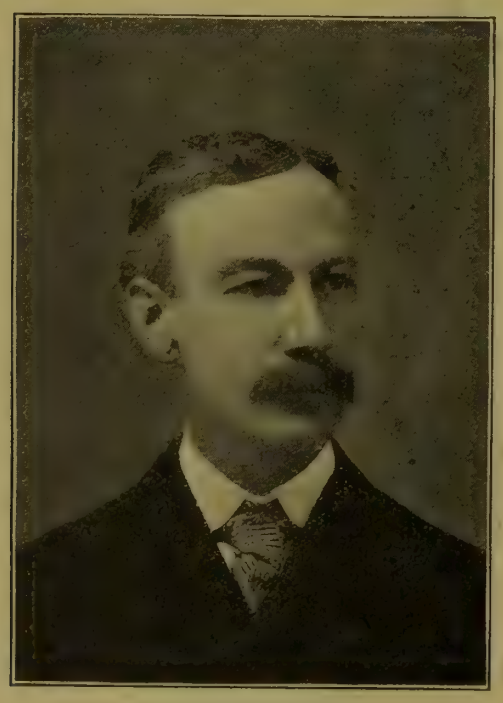
Friday, Dec. 25, 1903

THE CULTIVATOR ATTAINS ITS GOAL—TEN THOUSAND SUBSCRIBERS FOR 1904.

The Cultivator comes to its readers this Christmas week glad in the knowledge of success well earned.

The goal for which it has been striving the past year has been attained; it has reached and passed the ten thousand subscription mark.

Newspapers are, after all, much like individuals, they grow in proportion to the effort they make. They attain place and power as they fill the measure of their existence. They expand in influence as they grasp opportunities. The Cultivator may be excused if it departs from its customary silence on its own achievements, to speak of the work it is doing in the state, at the present time, as an educator of public opinion along the lines laid down for it by its owners. We think it not boastful to say that no paper



J. J. STEADMAN.

on the coast, either in California, or out of it, expends as much money for special contributors as the Cultivator. Its corps of writers cover the entire state, and treat of conditions as they exist in the locality from which they write. No journal in California attempts to parallel the Cultivator in this or other features necessary to a well rounded agricultural paper. Its contributors are the most able, practical educators in the state. They bring to their work the result of years of experimental study along the lines on which they write. They are equipped in knowledge and broadened by experience, and are recognized authorities in the departments over which they preside as contributors. No purely farm journal on this coast pays attention to the markets that this does, and its reports are as full as many of the daily papers of the state on California shipments of citrus fruits. The present owners of the Cultivator organized a campaign to attain ten thousand subscribers just a year ago. At that time the paper had less than seven thousand subscribers. It was thought, and results prove the correctness of the opinion, that there is a field on this coast for an up-to-date farm paper, with a policy broad enough to take care of all the agricultural interests of California. To make such a paper was their first endeavor. In this they have succeeded to an extent, although the maximum of excellence to be attained is a matter of the future. The Cultivator has only scored its first mile post in the race for better results all along the line. We shall make a better paper, command a greater field, and next year, at this time, write from twelve to fifteen thousand names on our books as subscribers.

* * *

Last year the paper was confined largely to the territory south of the Tehachapi. Today it reaches from San Diego to the Oregon state line, and its corps of vigilant field workers are pressing into every section of the state. Where there are two hundred subscribers in Humboldt and five hundred in Sonoma, and one hundred and fifty in Mendocino counties today, there will be double that number next year. So the ball will keep rolling until within five years there will be north of San Francisco five thousand subscribers, in Central California five thousand more, in the territory in which San Jose is located, where the Cultivator now has from fifteen hundred to two thousand subscribers, there will be five thousand. In Southern California there will be ten thousand reading patrons alone.

Why?

Because the paper will merit the increase, and because the people will be here by that time to warrant the extended circulation. In all the territory above alluded to this paper is pressing its lines—pressing its claims for preferment on merit alone. No false statements will be made by any one representing this journal in any capacity to secure either readers or business. Success will come in the future as it has in the past, from honest expression of opinion and from persistent endeavor to make a first-class paper and to get it into the homes of the people. No expense has been spared by the management to make it rank as the leading weekly farm journal in California. No expense will be denied it in the future, and if honest toil and vigorous effort and recognized ability in the contributors to its pages will avail to help it attain twenty-five thousand subscribers at the end of five years, they will be forth coming. So today the Cultivator, glad in the thought that a greater future awaits its efforts, glad that its past endeavors have been crowned with such marked success, sends greeting to its ten thousand and more subscribers, actual, bona fide subscribers, and with this Christmas greeting the wish that each and every reader of the paper may have long life, abundant prosperity and abounding good cheer in the year upon whose threshold we are just about to tread.

C. B. MESSENGER.

KEEPING CHRISTMAS.

To the tourist, sojourning for a time only, in this land of sunshine, and to the person but recently come to this state to mak his home, the absence of the snow covered hills and the sting of frost, and biting winds, causes a wonder if indeed this is only the old time Christmas season. It seems so peculiar to be without ica and snow; to hear the birds sing; to gather wild flowers; to sit in the friendly shade of the palm and acacia; to breathe the ocean scented air, so full of life and health; all this on Christmas. One can hardly realize the change. From the blizzard to sunshine and song, is indeed, a wonderous change. But this day has a meaning and thought strictly its own. No other holiday is like it. It is at once, a day for loving thoughts and deeds, a day for generous giving. "So long has Christmas been associated in the popular mind with the exchanging of gifts that we have lost somewhat the real meaning of the gifts," says a writer in the Home Campanion, "which are, indeed, only intended as symbols of love and good-will. Only to children do we give with that freedom and spontaneity which makes the gift more precious to the giver than to the recipient. To get as much as possible of this real old Christmas spirit toward one's fellows should be the engaging business of every one. We must be good to somebody on Christmas Day, and after buying toys for the children no one thing occurs to us that is so easy to accomplish and so full of results as taking a little thought for the lonely. Christmas is a festival of the family. But how many among our acquaintances are there who have no families; how many excellent old bachelors and lonely old ladies! We do not mean the poor—there are plenty of philanthropists to look after them, and they are usually well blessed with families; but a man may be as rich as Croesus, and yet if he have no place to eat but at a hotel he is poorer at Christmas than an Irishman with six children and only money enough for one meal. He belongs to a class which may well be an object of your solicitude. Perhaps they could buy you out thrice over, but you have a home and they have not. Be good to them—ask the lonely man to dinner. It is not for the dinner's sake, but the spirit in which you make them guests at your house, that these lonely people will

FRANK HONEYWELL.

bless you. And when they have told a story at your board, and dandled the children (if by good luck you have any), and sat about the fire in the evening; how much cheered and better they will go away; how it will warm their hearts to feel that somebody cared enough for them to ask them to be members of a family even for a day. That is all Christmas is for—to show other people that we love them, and to learn and be cheered by the thought that there are people who care about us."

Indicate Good Times.—John Wanamaker, of Philadelphia, the great financier, business man and philanthropist, takes the ground that strikes and lockouts are the best index possible to good times.

"What if there are strikes?" he asks. "Men do not strike in genuine hard times. And at present, the strikes are nearly all for higher wages or shorter hours. Such struggles are signs of prosperity rather than of adversity."

All of which is true. We never have hard times and strikes at the same time. Men are too anxious to earn enough to support their families without stopping to discuss wages, particularly when the country is enveloped in financial distress, as it was eight years ago. The most important thing for the American laborer to do now is, not to "kill the goose" that is laying us golden eggs. Let well enough alone.

But Mr. Wanamaker goes farther, takes an optimistic view of the future business conditions of the country and is confident the prosperous times we are enjoying will continue for at least four years longer, for he says:

"What if we had a depression in the price of stocks? That only affects those who have been gambling. The losses are not real, because the gains were only on paper. Actual money has not been destroyed. The farms, factories and mill are producing wealth in an ever-increasing volume. The railroads have all they can do carrying grain and merchandise. It is fortunate for the country that the break in industrials came soon. It checked the madness and fever of over-capitalization and points to the necessity for legislation to regulate trust methods."

FROM A BUSINESS STANDPOINT

J. W. JEFFREY.

J. W. Jeffrey is somewhat of a scrapper as well as a writer. Like the Irishman he will have peace if he fights for it. Believing strongly in co-operative marketing as the salvation of the fruit interest in which he has spent many years in writing in support of co-operative movements in general and especially of the Southern California Fruit Exchange. He fights for that principle.

This work for co-operative movements began when Mr. Jeffrey was Editor of the Azusa Pomotropic, from which his energies were transferred to the Culitvator. He is secretary of the horticultural commission of Los Angeles county.

BEGAN WITH THE CENTURY.

Four years ago it was decided, by the publishers of the Cultivator and many fruit growers and others friendly to the farmers interests, that it would benefit the cause of co-operation to delegate some one to present from time to time, facts upon the progress of the various co-operative movements that have engaged the attention of the farmers of Southern California, and to set forth the advisability of extending the idea of mutual assistance to other lines of rural industries. In following out the plan of a department devoted to the co-operative activities, it was designed to present faithfully the records of the past year in the marketing of fruits, to set forth impartially the aims and conditions of the co-operative institutions already organized for the protection of the farmers, and to suggest in a practical way how the idea of co-operation should be applied to a more extensive use. Readers of the Cultivator were then assured that this department would not be used for the advancement of any private interest, or the setting forth of any untried or impractical theory. There had been enough of achievement in the past, and reason for the application of hope for the future, to busy the pen of every one who may have had the opportunity of appeal to the farmers to engage more extensively in co-operative plans, and the writer of these lines was delegated to take charge of a department to be designated "From a business standpoint" in which the voice of the co-operators might be heard from week to week. For four years this work has been set before the readers of the Cultivator. Criticizing, sometimes caustically, but always fairly and under his own name, the writer has put down nothing in malice or defamation. In this course of plain, truthful speaking he has been supported by the publishers of the Cultivator, and the policy of fair criticism and free discussion so well established that there is now no opposition to this course among the friends of co-operative fruit marketing, whether they be members of the Exchange or of other organizations engaged in the legitimate fruit dealing at this end of the line. Outside of this department the Cutivator has invariably lent its editorial support to every plan that had for its object the betterment of the farmer and has become recognized as one of the strongest friends of co-operation in the state. The co-operative spirit now permeates every line of farming industry, and dominates most of them. The citrus industry, the business of selling walnuts, deciduous fruits, vegetables, berries, honey and many other fruits and commodities are influenced altogether or largely by mutual organizations and the spirit of further achievements is yet in the ascendency.

* * *

Brief Look Backward.—In celebrating its advent into the ten thousan figures of subscriptional patronage, the Cultivator compliments the farmers upon their achievements in building up the agricultural industries of the state, and in the masterful interprise they have shown, both in the raising of a greater, better tonnage and in the intelligence displayed in disposing of these products. In this uplifting process this journal has used every effort to assist in the establishment of bet ter methods of cultivation, in the selection of better varieties, in the improvement of processing and packing, in the introduction of the auxiliaries of farming, in stock raising, dairying and poultry raising, in business-like plans of marketing and generally in the improvement of the farming communities. The Cultivator has continually raised the hope of better conditions through mutual effort, encouraging public opinion in helping to reform commercial delinquencies, the faults of transportation, in helping to determine policies that should remove all antogonistic factors between the growers and consumers. The latter has been the theme of this department since its establishment.

A GREAT FIELD.

Sacramento, Cal., December 21, 1903.

Editor Cultivator: I must congratulate you upon having achieved the 10,000 goal for which you have been striving. I am not surprised that you have rolled up your circulation to this number, but rather that, publishing so excellent a paper as you do, you have not long since exceeded it. I have heard it said of men who have acquired enormous fortunes that the getting of the first thousand dollars was far harder work than the getting of all the rest, and so I believe it will be in your case. As the Cultivator becomes more widely known it will also become more generally appreciated, and your 10,000 will soon be buried beneath a circulation many times greater. The Cultivator has an enormous field, covering the whole Pacific Coast, and I cannot believe that you will hereafter confine your efforts to California, but reaching out will, in a few short years, count your subscribers by ten times ten thousand. You have my best wishes for this consummation.

Yours truly, JOHN ISAAC.

BUSINESS NOTES

10,000.

Ten thousand.

And a little over.

That's what the Cultivator claims.

And the Cultivator's claims go.

That is, when you see it in the Cultivator, it's so.

A year since we were publishing in the first column of editorial page that our circulation was 6800. That was good.

But we had an ambition. It was simply this.

Ten thousand subscribers before the sunrise of New Year's of '04, or bust.

We're not busted.

But the record is, and the first farm paper of this state to pass the mark of ten thousand legitimate subscribers is in your hands.

What do you think of it?

It's a hummer.

The only thing about it we're ashamed of is the price. Such a paper as this for a dollar for fifty-two numbers is not fair to the publishers.

Clean, bright and fresh stuff by a corps of competent writers in touch with the needs of the soil tiller makes good reading.

This has bound so many who "can't get on without it" to belief in the Cultivator that they prove strong friends in pushing it as well as benefitting by its advice.

Part of this advice has always been to patronize the firms which announce their goods in our columns.

This advice has been followed till the advertisers say "The Cultivator is all right; we get more returns than from all others."

So they keep advertising and new ones come in.

That's why you are reading a two-dollar paper for which you only pay half price. The advertiser pays for it.

Of course his financial returns justifies the advertiser in continuance or the advertiser would cease. Yet the reader owes to our advertisers patronage when it can be given. And when goods are wanted it is hard to imagine wherein one could not patronize Cultivator advertisers.

They are of the most progressive of the state.

They handle the best goods.

They are reliable men.

THE HUSTLERS WHO DID IT.

On first page of cover appear engravings of the field workers who have piled up the subscription list so as to give us a net increase of 3200 subscribers in the past year.

Their work has extended from San Diego to Shasta, and some of them entered fields where the Cultivator was unknown, and some, where it had been known many years. In nearly every case a kindly reception was given, and the Cultivator has grown.

* * *

J. A. W. Gates is one of the workers who has been on the Cultivator force a number of years. He has worked nearly all over the state. This year his work has been largely in the north.

Beginning in April in Marin county, across the bay, north of San Francisco, he worked north through Marin, Sonoma, Mendocino and Humboldt. From that section he sent in a thousand new subscribers. Mr. Gates is now in Santa Clara valley where the Cultivator has had a larger number of readers for some time. And even there the list of new subscribers now sent in is very large each week.

* * *

C. W. Williamson has been a Cultivator standby for years. There are but few sections of the state in which he has not traveled. For the past few months he has worked all through Ventura, Santa Barbara, and San Luis Obispo counties. Prior to that he worked in Santa Clara and Monterey. Earlier in the year in San Diego county. From all parts of the state Mr. Williamson says he hears enthusiastic words for the Cultivator.

A. W. Oliver, formerly from Oregon, more recently from Pomona, is one of the latest members of the hustling staff. In the Imperial valley alone (out on the "desert") he was only a few weeks in securing between two and three hundred new friends of the Cultivator. That valley was formerly largely Cultivator field but Mr. Oliver has captured the whole section.

* * *

H. B. Matthews has been with the hustlers only part of the past year. His home is at Riverside. His work was largely in southern counties but for the past few months he has been in charge of the work up in the great San Joaquin valley. Fresno was the headquarters and from that point many new subscribers have been reached. On south through Fresno, Kings, Tulare and Kern counties the work has been done.

* * *

Mr. Matthews' right hand helper and successful canvasser has been Albert Maring. He recently came to California, the graduate of an eastern agricultural college, and is taking this means of getting information of the great resources of this state and of doing the Cultivator some good.

Besides these, Mr. Tuttle, not now with the hustlers, made an extensive canvass of the Sacramento valley earlier in the season. His work carried him well up to Shasta county.

And so the ten thousand is reached. About 5000 north of Tehachapi and 5000 south.

Will our readers help to increase the list?

* * *

THE OFFICE FORCE.

The lower engravings on the first page of the cover have most of the beauty of the Cultivator. The people there represented have to do with the inside detail work.

Duncan L. Smith is foreman. He sets the ads that appeal to the ten thousand. And they're good looking ads. The whole appearance of a paper depends much on the ads.

J. C. Thorpe is "the lightning mailer' and is in charge of the mailing galleys. He takes the names of new subscribers as they come from the field, and through the mail, and adds them to the mailing galleys. These new names to be added each week show a net gain of 140 per week for the past few weeks. Besides these, a vast number of changes are necessary in "advancing" each name when payment is made. These changes take a great amount of time, though they are handed by towns and counties so as to simplify the matter as much as possible. But 10,000 names means much detail work.

There are 114 mailing galleys, which require nearly a half ton of type to set all the names. This large amount of type is more surprising when it is seen that only one short line is required for most names. Most of the lists are "town lists" where large packages are rolled for one postoffice, so that no postoffice address is given in the mailing galley.

The rapidity with which these papers are disposed of is remarkable. The 10,000 are usually labelled, wrapped, addressed, tied and in mail sacks by 12 o'clock each Friday, the work being started about 8 o'clock. This is 2500 papers per hour, or 40 per minute. This can only be done with the best of methods and systematic work.

After addressing and wrapping the bundles are assorted for the mail sacks. The sacks are filled in this office from which they are taken to the central postoffice and weighed, thence direct to the trains without opening. Six sacks go to San Francisco for distribution to the surrounding section, others for the coast line, others for San Joaquin valley line, and so on.

All told there are eighteen to twenty sacks, which weigh aobut three-fourths of a ton and make a good two-horse dray load. The mailing is done so as to catch all mail trains of Friday afternoon. The aim is to have the paper in all postoffices of the state by Saturday evening.

The postage bill has increased from $3, which it was a couple of years since, to $12, at present. It will require the dollar each from about 700 of next year's subscribers to pay the annual postage on the papers.

VETERINARY DEPARTMENT

DR. H. D. FENIMORE

Dr. H. D. Fenimore, the veterinary surgeon who answers the inquirers and gives prescriptions for sick animals, has a large practice in and around the city of Los Angeles and has been universally successful in his treatment of animal diseases. We have known of some cases where his suggestions as given in the Cultivator have been followed and led to remarkable results. The article this week is rather more than the Doctor usually has time to write for us, as he is compelled to confine his writing largely to immediate instructions in cases of sickness and injury of domestic animals. The Doctor has given much valuable assistance, and we believe his department is appreciated by the readers of the Cultivator.

DEVELOPMENT OF HORSE SHOES.

The earliest mention of the horse was in Egypt about 1700 B. C., while the first picture dates from about 1500 B. C. From this time on, the horse is frequently represented, both by the Greeks and the Romans, but there was not found any trace of protection to the horse's hoofs until about the time of Alexander the Great. When the great cavaliers were frequently delayed in order to let the hoofs of the horses grow that had worn their feet sore.

This led to the invention of the "Auereisen" or cure shoe. This was a thin plate that covered the whole bottom of the foot, having edges turned up with loops, or rings through which small ropes were drawn, and in this way the shoe was fastened to the foot. This mode of fastening to the shoe by ropes was not secure enough, and besides making the movement of the animal very clumsy, it wore the crown of the hoof and pastern sore. A remedy for this defect was small straps of iron fastened to the turned up border, with small beaks turned in, which were fastened in the wall of hoof, in the form of hooks. This mode of attaching evidently was also insufficient, and so the fastening of the shoe by nails was adopted in the twelfth century. The fullered shoe, made of a band of iron turned in the shape of the horse's foot, made its appearance about the time of the great crusaders, and was followed in the fifteenth century by the addition of calks. The shoe was continually improved and reached a high point of perfection before the sixteenth century, when the whole art of mechanics, and especially that of blacksmithing, had taken a great stride. This improvement continued until, at the present time, we have an infinite number of different styles of horseshoes, some of them marvels of ingenuity, and many are effective remedies in correcting faulty gaits, and uneven action. The mode of attaching the shoe to the foot with nails is a necessary evil that we must endure, until we are prepared with a substitute of less serious objections. The wall of the hoof consists of an infinite number of hair-like tubes cemented together and each tube aids in diffusing broughout the horn a fluid that nourishes and preserves it. Nails driven through the structure aid in cutting on the supply of material necessary to the foot's existance; so that every nail driven means so much injury to the foot. Various inventions in the forms of nailless horseshoes have been invented, but they all have their objections. It is to be supposed that the next will be either in the form of a soft preparation that will adhere to the foot; harden and afford the necessary protection, or that a shoe may be invented with the proper devices for application to the foot, so that an air chamber may be formed. This may be exhausted, and the shoe retained by means of atmospheric pressure.

* * *

CATARRH.

Will you tell me through the Cultivator what is the cause of a cow running at the nose. Is it indigestion? She was out to pasture last spring; shortly after getting her home she acted sick and refused to eat. I consulted a veterinary surgeon and he advised a drench of salts. Nose run then an it seemed like she could not chew good. She got better and in a month or two had an abortion at seven months. Milk came and she gave from five to six quarts. She is in good flesh, seems to feel well, but by spells nose runs. Please tell me what causes it and what to do for her.—A Subscriber.

Give one teaspoonful of eucamphol in a pint of water twice a day.

WEATHER AND CROPS.

Director McAdie reports the following weather and crop conditions for the week.

The temperature was nearly normal throughout the state during the week. Clear weather prevailed in the southern section and cloudy or foggy weather in the central and northern sections. Light showers fell in portions of the south and heavy rain in nearly all places from San Francisco northward, the precipitation ranging from 1.50 to 4.75 inches for the week.

In the northern districts the heavy rainfall caused a temporary suspension of farming operations, but plowing and seeding are well under way and a large acreage of wheat, oats and barley has already been planted. Early sown grain continues in excellent condition and is growing rapidly. Green feed is abundant and of good quality, and stock is doing well. In the southern districts the scarcity of rain and the drying winds have materially retarded farm work, and plowing and seeding are very backward; green feed is scarce and cattle are in poor condition.

With the exception of about one-half inch of rain in September and light sprinkles since, there has beeen no rainfall in Southern California during the season.

The development of Southern California oranges has been greatly checked by the recent high winds and cool nights, and picking has been partially suspended. In the Oroville and Porterville districts the orange crop is being rapidly picked and shipped. Orchards and vineyards are in good conditions in most places and pruning is in progress.

A. J. McCLATCHIE

The newest contributor of the Cultivator force is Prof. A. J. McClatchie of Phoenix, Arizona. Prof. McClatchie is an old-time Californian who was drawn on by the University of Arizona to take charge of experiment station work of the Territory. This he has done in such a manner that his reputation as an authority on Eucalypts has spread beyond the bounds of this country. That and his grasp of the larger problems of irrigation make him an exceptionally valuable contributor. His articles during the coming year should give enough information to any one who may be interested in Eucalypts and how to give best culture under all conditions, should be well worth the one dollar which any person may pay as subscription to this paper.

The Cultivator regrets that Mr. McCatchie's communication did not arrive this week, so we are unable to make the paper complete in this respect.

According to a government bulletin there are over 1,949,605 goats in the United States. They are easily raised here, still we import goat skins every year to the amount of $16,000,000 to $25,000,000.

Place Your Orders Now

(For Season 1903-4)

TREES

FOR SALE

Deciduous, Citrus and Ornamental Trees, Grape Vines and Rose Bushes

Winter Bartlett Pears

Have you heard about them? Of all pears of recent introduction, this pear takes the lead. It does not ripen until November, and will keep two months after picking. We have a good stock but orders should be booked early.

Peaches

The canners want more clings, couldn't get enough this year of Tuscan, Phillips, Orange and McDevitts. You can make no mistake in planting clings if there is a cannery in your vicinity.

Burbank's Sugar Prune

This is a great leader. The fruit is larger, sweeter, and ripens fully three weeks earlier than the French prune. No danger of having your fruit damaged by rains when drying if you plant the Sugar Prune.

Calimyrna Fig Trees

The Genuine Smyrna Fig of Commerce

To give this fig the distinction it deserves, and at the same time to honor California, the state in which it was produced, we have named it "Calimyrna," a combination of the two words California and Smyrna.

Think for a moment what the Washington navel orange has meant to the fruit industry of California and you will get some idea of the importance that should be attached to the Calimyrna Fig, which was originated by Mr. Roeding.

You may satisfy yourself as to the merits of these Calimyrna dried figs by sending to us for a sample box, which is sent to any address post paid on receipt of 20 cents.

In order to protect the planter as well as ourselves we have devised a seal, so you will find all our Calimyrna Fig Trees this seoson branded

Calimyrna
R
Fresno

None genuine without this seal.

General Agriculture

PRESERVING FENCE POSTS.

The Iowa Homestead, in speaking of the means to be taken to preserve fence posts, says: "Proper curing is the first step in the successful preserving of timber. Painting or covering of any kind is not effective unless the sap is well dried out. Decay is largely brought about through the agency of fungi, and moisture is very necessary for the growth of these lower organisms. If paint is applied while the wood is still green, the coating prevents the cells from drying out, and decay is promoted rather than hindered. An effective material for preventing decay is coal tar. This is largely employed by telephone companies and other large companies for this purpose. The tar is best applied hot, as it then penetrates deeper; the addition of a small amount of turpentine is of assistance in this regard. Professor Green of the forestry department of the Minnesota Agricultural college recommends the following formula: Three parts of coal tar and one part unsalted grease. This prevents the tar from drying too quickly and secures a deeper penetration into the tissue. One barrel of tar, on an average, will cover 250 posts. Soaking the ends of the posts in kerosene is recommended as a preservative by some. Charring, if carefully done, is also useful. A layer of charcoal is valuable for this purpose, but the work must be done carefully, however, otherwise the ends are apt to crack severely, and the charring does more harm than good."

RECLAMATION OF ALKALI SOILS

In circular No. 11, U. S. department of agriculture, bureau of soils, is published the results of experiments in reclaiming a 20-acre tract of alkali land by drainage and irrigation at Fresno, Cal.

In 1900 the bureau of soils recommended drainage and irrigation for the land in that vicinity, which was worth $350 per acre in 1889. Since that time the land has become so saturated with alkali as to render it unfit for crop production. As the farmers were unwilling to go to the expense recommended, the department decided to make a practical demonstration of the recommendation, and accordingly in December, 1902, ditching was commenced and a system of 3, 4 and 6-inch tiles were laid down. In July, 1903, practically all of the alkali had been taken out of the land so that crops could again be grown. The cost of draining this tract of land was $16.50 per acre.

Those farmers in California who are troubled with alkali in their soils should write to the department of agriculture for this circular.

DOBBINS.

Signify to the horse in some other way than by a blow or oath what you want it to do. The first way is brutal and the other way is silly, if not sinful.

Use the curry-comb, but use it mercifully; it's the dirt you are after, not the skin.

That stiff scrubbing brush the wife uses in house cleaning is a good and merciful horse cleaner. But don't appropriate her's.

So treat the horses that they will be glad to see you come into their stable, and not act as if they would like to climb through the roof.

Teach the colt when it is young and you will not have to break it when older.

Cleanliness of person and stable may not be godliness to the horse, but it is good feelingliness, which is probably more important from the viewpoint of the horse.

Rely less upon drugs and more upon good care to keep the horses in good shape. Condition sanitary will beat condition powder every time as a condition maker.

CITRUS STOCK

Season **Navels** **Navelencias** **Valencia Lates** **1904**

All stock two years old on four-year-old roots. First-class in every particular. Large, healthy, clean. No better anywhere. Write us for prices.

Mills & Masters

JAS. MILLS, Mgr. RIVERSIDE, CAL.

RIVERSIDE NURSERIES, Riverside, Cal. Fullerton, Cal., Oct. 24, 1903.

Dear Sirs—It is with no small degree of pride that I point to the orange orchard that I set out in June, 1902, with stock from your nurseries. I am not acquainted with any orchard of similar age that has done so well, and is today so promising. This certainly speaks in no uncertain language of the character of the stock coming from your nurseries. Very respectfully, CHARLES CHAPMAN.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

JOHN ISAAC

One of the newer writers on the Cultivator force and at the one of the oldest and best writers on the coast, is John Isaac. Years ago he edited a paper in San Bernardino, later did newspaper work in Los Angeles, also in San Jose, was assistant to the Secretary of the State Board of Horticulture and is now secretary to the State Horticultural Commissioner.

This wide experience fits Mr. Isaac to give information and the commendation his articles receive shows they are appreciated.

With headquarters at Sacramento, he has opportunities to be of value to our increasing list of northern readers.

THE YUCCA AND THE PALM.

Why do so many Southern Californian people and papers persist in calling the giant yucca of the desert the "Yucca Palm?" It is not in any way a palm, does not look like a palm, has not the characteristics of a palm, and is not even distantly related thereto. It is no more right to designate it a Yucca palm, than it would be to speak of an orange-apple, or to join any other two dissimilar species of the vegetable world in such unholy union. The desert yucca, is a yucca and nothing else. Its proper name is "Yucca arborescens," or tree yucca. It is a member of the lily family, and is rather a giant lily than a palm. We trust that hereafter in speaking of this great feature of our desert landscape, that the Southern papers, which at least ought to know something about it, will not attempt to force this plant into a family with which it has no desire to affiliate, but leave it in the more humble sphere which it graces and at which it stands at the head, for we are convinced that our humble vegetable friend would rather shine as the head of the Yucca family than come in at the tail end of the palms.

* * *

SIMPLE METHOD OF HYBRIDIZING

Marcus Woodward is authority for the statement that the method of crossing two fruits is simplicity itself. The horticulturist merely takes the pollen from one flower and dusts it into the stigma of the flower of another specimen. The result is a hybrid. Now, what could be easier than that? It seems that we have been wasting a great deal of admiration on Luther Burbank for doing such a simple thing, and now that the secret is out everybody will become Burbanks and we shall have an endless variety of new fruits and flowers. Why, that's as simple as the many systems of getting rich. All that is necessary is to buy things when they are cheap and sell them when they are dear. Anybody can do it.

* * *

A STRANGE FRUIT IN SHASTA.

Some one, away up north, in Redding, planted a pomelo seed and it grew and bore fruit. But no one in that section had ever seen a pomelo before and it surprised them. The newspapers there have made the most of the wonder which is described "A fruit shaped like a mammoth pear, with the skin of an orange. The supposition is that in some manner during the blossoming season a pear tree adjoining pollinated the orange blossoms, producing the freak fruit." If the writer had known the rudiments of botany or horticulture, he would have known that cross-pollination does not affect the fruit on the tree, but changes the character of the seeds and these seeds if grown produce the new variety, also it is an impossibility for trees of a distinct variety to cross. The laws of nature are uniform, the same in the vegetable as in the animal kingdom, and cross breeding does not change the individual upon which the cross is made but their progeny, and crosses cannot be made except within certain well defined lines. This much for the information of those who believe such stories as that from Redding.

* * *

GOOD FARM PRODUCTS IN THE NORTH.

The season in the northern counties is so far a very promising one. Rains have been abundant and have been followed with good growing weather. The farmers are busy in the grain fields and there will be no apparent diminution in the grain area this season. Hay has been ruling at such high prices that a very large acreage of grain is being sown with the intention of cutting it for hay. Pruning is well advanced, but is still going on in the deciduous orchards, and vineyard pruning will soon commence. In spite of the alarmists who are predicting direful results from an overproduction of fruit, the orchard area is being widely extended, and nurserymen state that their orders for the coming planting season are heavier than usual, the heaviest demand being for apples, apricots, peaches and prunes in the order named.

* * *

THE SCUTELLISTA STILL SPREAD

I am surprised at the continued reports that are being made in regard to the work of the little South African parasite of the black scale, the Scutellista cyanea, although I was prepared from my early acquaintance with it to expect much. But its spread and the results of its labors have been so much greater than I had ever expected, that I cannot but regard it with astonishment. It looks now, as though we had for the black scale an enemy that will do better work in its line than even the Vedalia cardinalis ever did with the cottony cushion scale, although it is rank heresy to say it. But from all sections where this little fly has been established repors of its spread and work are so flattering that we may now safely assert that the days of the black scale as a pest are over, and it is not improbable that we shall soon be collecting specimens of the insect as a curiosity. Now let us get a parasite for the codling moth and then we shall be fixed.

BY J. W. MILLS, ONTARIO, CAL.

J. W. MILLS

J. W. Mills, one of the contributors to the Cultivator who has given long service which has been the means of greatly extending the Cultivator's popularity and of giving a vast fund of information to readers of this paper. Mr. Mills is a graduate of the Agricultural Department of the State University, and for years has been in charge of the Government Experiment Station at Pomona. This experience gives Mr. Mills peculiar qualifications to give to our readers far more than value received.

If Mr. Mills is stronger in one line than others it is in knowledge of the grape and its culture. But in citrus and deciduous trees he is exceptionally strong.

ABOUT ALFALFA.

Editor Cultivator: Will you kindly kindly tell me what kind of alfalfa seed is best for hay and how many pounds are necessary to plant an acre? Also how much grain to sow with it? —J. G. W., Orange.

Utah seed has had a run for many years with California alfalfa growers, but any clean plump seed is good. The chief point to keep in mind when selecting alfalfa seed is to look closely for weed seeds. Love vine or Dodder has a seed that is likely to be overlooked when it is quite plentiful in alfalfa seed. It is about the same size but much lighter in color and is not the same shape.

The Tulare Station reports that the recently introduced variety from Turkestan starts much quicker after cutting and produces more hay per-season than the ordinary kind.

It is necessary to get a good stand the first season in order to get a good stand at all, for an alfalfa patch that is spotted and poorly started, will never be otherwise. The only remedy is to plow it up and start over. If the seed is to be put in broadcast, about 25 pounds is the right amount of seed to sow. Of course this is a heavy sowing and is given as the correct weight for ordinary land where irrigation is not practiced for starting. On good sandy soil, with plenty of water for soaking the ground before planting, 18 to 20 pounds are sufficient. If a drill is used, 7 to 10 pounds will do on moist sandy soil.

We would not plant grain with alfalfa seed. It is just as bad as planting weeds except that some hay may be harvested the first cutting. This is no advantage as the cutting of alfalfa should be left on the ground to shade the stumps of the young plants. This is supposing that the planting is done in the late winter or early spring when most planting is done. Where irrigation is practiced on soil free from alkali, the experience of the best growers seems to show that September is the best time to plant alfalfa. If the land is properly prepared and sown immediately after a thorough irrigation, the plants will come up in a few days and be old enough to stand severe frost, and when summer comes, several crops may be harvested, while if the planting were done in the spring the whole summer would not produce more than one good crop. If the land contains considerable alkali, it would be folly to plant in the fall or early spring. Experience has shown that such land should not be planted to alfalfa until all rains are over in the spring. If a crust forms on the surface after the seed is sprouted and before the plants are large enough to shade the ground, alkali will rise and ruin the stand. Such land should be thoroughly cultivated after each rain so as to stop evaporation. This will keep the soil moist and keep the alkali evenly distributed throughout the soil and not allow it to collect at the surface. Sometime about the first of June, sow the alfalfa seed, 20 pounds per acre if broadcasted and 10 if drilled, about three-quarters of an inch deep. All of the previous cultivations should be shallow so as to secure a firm soil below the first two inches. If the harrow is used the last two or three times, with the teeth slanting well back, the land will be in fine condition for seeding. If it is broadcasted, harrow in with a harrow, just as though wheat or barley were being planted. We have succeeded in getting a perfect stand by this method by planting on the 7th of June, on alkali land, while on adjoining land, the owner failed three successive seasons in trying to get a stand in the old way of planting in the early fall and early spring. On the 15th of last July we planted an experimental plot to alfalfa on damp land that had been cultivated up to that time to keep down morning glory, and in less than a week had a perfect stand that is now 10 to 15 inches high.

* * *

CARE OF ALMOND TREES.

Editor Cultivator: Will you please give me some information through your valuable paper, in regard to the care and pruning of almond trees. We have a few soft and hard shell trees that did very well this year, though they had not special care in regard to pruning.—Subscriber, Lordsburg.

The almond requires very little pruning after the third year. During this time it should be pruned just about as a peach tree should be, giving it three main branches to form a head that will not result in crowding the branches when they become of large size. The second pruning should leave the branches at least two feet above the points of union with the three left at the first pruning. The third pruning should add another two feet to the top. After this, practically no pruning should be done for a number of years at least. When a branch becomes bent so as to interfere with others, it should be removed. Suckers, or water sprouts, often spring up from the main branches during the early summer, filling the center of the tree with dense brush. These sprouts should be removed when they first appear. If allowed to grow all summer, much pruning will be necessary during the winter in order to thin out the center. Besides, if they are not removed early in the summer, they will cause the death of quantities of fruit spurs and small fruiting branches that grow low down on the main limbs. These water sprouts indicate that the trees are thriving and are getting plenty of sap, and if they are handled as described, the sap that would go to the water sprouts will go to fill out the nuts and form more fruit buds for the following crop. Almond blossoms come from wood that grows the preceding summer, hence it is necessary to get as much growth as possible on the fruiting branches.

* * *

WIND-BREAKS.

A grower who lost heavily by the recent wind, told us that he would not want a wind-break because the wind, as it came down from above the hedge, was given a sort of rotary motion that twisted his trees more than where the wind got a free sweep at them. This has been the experience of a good many growers who have solid wind-breaks. Theory and practice both seem to affirm that a barrier that is tall, but thin enough to allow some of the current of air to pass through, is much better than a solid mass of trees or no trees at all. The effect seems to be that a body of air goes through the orchard at a reduced speed and this shuts off or causes the descending currents to rebound before they reach the trees. This method of growing a wind-break seems to apply to tracts of land of 10 acres and upward. Where ten acre tracts are divided into four sections by cross hedges, little damage seems to be done by the wind. Some of the Cucamonga growers declare that this method of growing hedges is a decided protection against frost also.

Where there is a high piece of ground running through a grove, it is always best to plant the wind-break along this higher elevation.

* * *

CURING CITRON.

In answering a question regarding this subject, we will give the method used in Corsica as observed by the late Rev. C. F. Loop, of Pomona, who visited that place and learned the method of curing the citron of commerce.

The fruit is picked before it turns yellow, yet not until it shows a change of color from the dark green to the green that indicates a change toward ripening. The fruit is quartered when large and halved when small and the pulp is removed, leaving a solid rind from half an inch to an inch thick. Sea water is used to pickle them in, but when this is not available, a brine is made strong enough to float an egg. The prepared fruit is submerged in the brine and kept in a cool place for about two weeks. At the end of this time, fermentation will have proceeded so that a very susceptible aroma is given off and if the ear is placed over the barrel containing the fruit, the escapement of gas may be heard distinctly. The fermentation is necessary to break up the oil cells and distribute the aroma evenly throughout the tissue. The fruit is then removed and cooked in fresh water until heated to the boiling point clear through. This stops the fermentation and removes part of the salt. A sugar solution of about five (5) per cent is then made and put over the fruit, brought to the boiling point and allowed to stand in a cool place for about 24 or 36 hours. If the fruit is kept in a warm place at this time, it is liable to ferment and turn sour, as we found by experience. The syrup is then drawn off and thrown away. It is not economy to use this syrup again as it is bitter and contains some salt. Another syrup of about 10 per cent sugar is placed over the fruit, brought to the boiling point and treated as before. Tihs syrup is also thrown away and one of 20 per cent used as before. The final syrup of about 25 per cent is added, with a little glucose. The fruit is allowed to remain in this for two or three days and is then laid on plates to dry. The result is a good commercial grade of citron ready to pack. The glucose is added to prevent the sugar from crystalizing and making the product hard and rocky.

There is a high grade of citron put up in California now and we are told that it is made of ripe fruit instead of that which is just turning. We once prepared some citron as described above, except that we used the ripe fruit, and a local groceryman told us it was better than the imported article that he had in stock. However, we did not agree with him, but it may have been that we were not educated up to the sudden change of using the ripe fruit instead of the green.

J. W. BAIRSTOW, HANFORD, CAL.

PROF. A. J. COOK.

Prof. A. J. Cook of Pomona College, formerly of the State University of Michigan, the author of works on bee culture and insect life and writer in the Cultivator for so many years that he is probably as well known to the ten thousand subscribers of the Cultivator as he is to the proprietors. He may not need any introduction from us, however, we may say that Prof. Cook's interest in this paper has been no small factor in its growth.

Prof. Cook's speciality where he is stronger than anything else when working for farmer's interests, is in inspiring the organization of Farmer's Clubs and in conducting institutes, Clubs and in conducting institutes auspices of the State University.

A. B. C. OF INSECTS

(Continued)

In our stroll through the insect world, we have now come to the next to the last order of insects—the Moths and Butterflies or the Lepidoptera. These are usually regarded as the gems of the insect world, and indeed they are of rare beauty; yet I think that many beetles and not a few Chalcid flies easily rival even the most attractive butterfly, or moth, in beauty.

The word Lepidoptera means scale-wing and is appropriate, as the four wings of these insects are covered with scales of varied hue and pattern and thus it is that they are so beautiful. As all know we must handle these gems of nature's own fashioning with great care, or we greatly mar their beauty. This is easily explained, we rub off the delicate scales and thus mar the color mosaic of these organs.

The mouth organs of the larvae, or caterpillar, are typical of the biting type. In the imago or mature insect, however, the mouth organs are profoundly modified. Here we find a long sucking tube. In some of the species, like the sphinx moth, this tongue is very long, enabling them to reach deep down into the long tubular flowers. This tongue consists of the two maxillae which are both grooved on the inside and so when they are closely approximated they together form a closed tube. In some moths this tube is almost wanting. This is true of all the silk moths. Except these maxillae, the mouth organs are very abortive, if we except the labial palpi, which curve up and closely embrace the rolled up tongue, one on each side. The imago feed but little, and this little consists of nectar or water.

I hardly need to say that the transformations are complete. The caterpillars are either hairy or smooth and usually have sixteen legs. Some like the measuring worms or loopers have only ten legs and a few show twelve or fourteen legs. Some of the Noctuid or night flying moths like some of the cut worm moths have fourteen legs at first, and sixteen afterward. The pupa of Butterflies is called a chrisalid. These have no cocoon but hang up all exposed to twig, wall or leaf. Many are suspended from the under side of the leaves that the caterpillar has not devoured. The pupae of moths are variously protected. Many, I think most, spin cocoons, like the silk moths, others like the sphinx and noctuid moths pupate in the earth. A few like the peach borers pupate in their own chips.

I hardly need say that this is one of the destructive orders. All feed on plants, and so in case the plants are useful are our enemies. The thistle butterfly which is on occasional years so common that it swarms about us in countless thousands is of this kind. It works on weeds and we may well wish it all success.

Caterpillars are great feeders. One can hardly appreciate this till he has once fed a group of caterpillars. Those who have fed the silk worms will need no words to impress this fact.

Lepidopterons, economically fall under two groups. All feed on plants and so like the locust order, are injurious to vegetation, yet some are of paramount value. I refer to the silk moths. These give us a product that amounts to millions of dollars in value each year. As yet silk raising is of little importance in the United States. France and other European countries have grown the insects so long that they are very proficient in the production of silk, and we, owing to the higher price of labor, find it difficult to compete with them. Some are enthusiastic enough to believe that we could do so.

Of the injurious species, most do harm by feeding on the foliage of plants. Several feed on fruit. A few, one whole family, are exclusively borer one whole family, are exclusively borers. Some keep the weevils company and feed on stored grain, and others like the clothes moths feed on house hold products.

In our next we will refer to the most conspicuous of these enemines and give hints as to the combatting them.

* * *

ORANGE CATERPILLARS.

A. G. Simmons, Redlands, sends me an orange containing a caterpillar and what he thought were eggs. He asks if it is dangerous. The coloration or orange led to its discovery. This is the quite common orange caterpillar and the supposed eggs are the droppings. Prof. Craw has known these caterpillars to be in Southern California for twenty years. I have known them since I came here ten years ago. These caterpillars are the larvae of a Tortricid moth, one of the leaf rollers. It is closely related to the codling moth. The caterpillar feeds for the most part on foliage, but occasionally resorts to the fruit. It seemed to increase very little and I think need cause little apprehension.

I do not think more than one orange in a hundred has been affected even in the worst years and in the worst affected orchards. The caterpillar bores through the peel and works in a little burrow which is often concealed by a slight web. As is the case with the codling moth larva in the apple, so this caterpillar causes permature ripeness. If the insect ever should become alarmingly prevalent, it might be desirable to gather and destroy the affected fruit, or at least, destroy the caterpillar. The early coloring of the orange would, I think, make this practicable. I am glad our orchardists are on the sharp watchout for such pests as it promises quick detection should the terrible Mexican orange maggot gain access to our orchards.

* * *

OAK GALLS.

G. W. E., Santa Monica, wonders if oak galls are seriously injurious. He says he knows the nature of the insect, but their rapid increase on diseased trees made him anxious. He wonders if a remedy is called for. As Mr. E. knows, the galls are the result of the egg laying of a minute fly. This stimulates to extra growth and the galls result. One great family of the bee and ant order,—Cynipidae—all produce these galls, and nearly all infest the oak, at least that tree is the favorite. The galls are often beautifully colored and are well named oak apples. The larval Cynip uses the gall both for home and food. After it has reached its growth inside the gall it finally emerges as a fly to again lay its eggs. The hole in old galls shows where the fly made it exit. I do not think these flies materially injure the trees. Their increasing numbers indicate that the past year or years have been favorable to these species. I do not think their presence is owing to the diseased state of the trees. Very likely next year they may be very much less in number.

The oak twig borer also troubles Mr. E. These are long horned beetles and do often work a good deal of mischief. In all such cases, where the trees are not too large, the twigs as soon as they show by their dying leaves that the bores are present should be cut off and burned. This is the best practical way to treat all twig borers.

Mr. E. is further troubled with the borers on the body of the tree, just under the bark. These are undoubtedly bigheaded borers or Bupestrids. As I stated in a previous number of the Cultivator, washing the tree trunks in early spring with soft soap or a strong soap solution will prevent egg laying and so forestall the mischief. In case of large trees, it is usually safe to neglect treatment for both twig borers and the big headed borers, especially in case of large forest trees.

I would thank Mr. E. if he would send me speciemens of both these borers.

* * *

SAN JOSE SCALE.

Subscriber, Almaden, Cal., asks for remedy for the San Jose scale. Spraying with the salt, lime and sulphur wash in winter is the approved method of fighting this pernicious scale. Subscriber should send either to Berkeley or the Horticultural Commission, Sacramento for the bulletin on Insecticides. Every one should have this in his possession. Let me urge that in preparing this salt, lime, and sulphur wash that the time of boiling be not stinted. I have found the wash less effective in case of under boiling.

* * *

APRICOT SCALE.

D. D., Edenvale asks for treatment for the brown apricot scale. I would suggest that he secure through Mr. Ehrhorn of Mountain View, Entomologist for Santa Clara County speciemens of the little chalcid, Comys fusca. This is a very effective enemy of this scale and is usually enough to practically eradicate it.

The same advice applies to M. H., who also inquires about treating scale and spiders. The bulletins mentioned about give explicit directions.

* * *

THE CULTIVATOR.

I wish to congratulate the proprietors of the Cultivator, on the phenomenal success of the paper. I acknowledge to a little bias, and so would hardly feel like trusting implicitly to my own judgment as to the exceeding worth of the paper, except that I have heard such hearty and frequent commendation from others. Many have said to me during the last few months that it was one of the very best agricultural papers published in the country. Its exceptional growth of late, most gratifying proof that its value is widely appreciated, emphazies the fact that our people are alive to the best things, and are quick to grasp the helping hand. The requisites of a first class agricultural paper are that it shall be up to date; shall lead in all lines of agricultural progress, shall keep in touch with the best practice in all the region where is circulates that its readers may be fully informed in all methods that will help them to better success. It is very evident that the Cultivator is sparing no pains to accomplish all in these several directions. This is why I have heard so often such remarks as Mrs. Sherman made to me a few days since, that she regarded the Cultivator as one of the very best papers that came to her table, and she takes nearly all of the leading agricultural p pers of the country. She said that it easily leads all others in value as an advertising agent, and she gave me permission to make this statement. I am glad that the proprietors are resolved to utilize their prosperity in enlarging the paper and making it still better in every department of its work. It is also gratifying that the managers of the paper have no time for contentions or captious criticism but are resolved to hold the paper steadily to a high toned presentation of agricultural truth and advancement.

GO TO GARDENA

Gardena is located in the center of the broad fertile valley between Los Angeles and San Pedro; has two electric lines giving the very best facilities for marketing products.

It is without rival in regard to climate, soil and water supply.

The soil is adapted to berries, alfalfa, vegetables, walnuts, etc.

To illustrate what can be done, we visited the model ten-acre ranch home of Messrs. Burge and Michael near Gardena. They kindly gave us an itemized statement of sales of produce for the year 1903. The walnuts (nearly 4 acres) were sold for $731.79; small fruits, vegetables, hay, chickens, eggs, cream, etc,, $818.77, making a total of $1,550 56. Can you ask for a better investment?

For Sale, 10 Acres, $4500

House of 6 rooms, barn, farming tools, hay in barn, 1 horse, chickens, etc. One acre in alfalfa, balance in orchard, mostly apricots. $2,000 cash, 6%, good time.

5 Acres, $2,000

Three acres young strawberries; balance alfalfa and garden. Horse, cow, buggy and farming implements.

5 Acres, $1,400

Two and one-half acres new strawberries,

20 Acres, $2500

One acre strawberries, 3 acres apple orchard; 7-room house; barn. Easy terms.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house' sheds, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house and barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

Coast News and Notes

BY R. A. DAGUE, COR. SUTTER AND SANSOME STS., SAN FRANCISCO

R. A. DAGUE.

Ex. Senator R. A. Dague formerly from Iowa but now a resident of Alameda, from which place he goes each morning to our San Francisco office, is an old newspaper man of many years of experience who picks out the newsy items from all over the State and gives our coast news. We believe this department is adding to the popularity of the Cultivator in this that it gives the gist of the news in a few words. This gives the busy farmer an opportunity to get a general view of the State without running through columns of stuff to secure it.

AGRICULTURE.

The potato crop of Great Britain is very poor.

Oregon is sending large shipments of potatoes to San Francisco.

The California loganberry is finding great favor in England.

The exports of hemp from the Philippines will be large this winter.

The Spreckels Sugar Company is offering $4.50 per ton for beets, at the factory.

The beet sugar industry is developing rapidly in Utah, Idaho and Colorado.

Oregon wheat is being rushed to market. It is bringing at this writing 65 cents a bushel.

An eastern seed firm will buy 150 acres near Modesto and engage in raising seeds for the market.

The celery output this year of Orange county exceeds by 450 carloads that of last year, or about 2000 carloads in all.

The California Raisin Association distributed this season in Fresno and vicinity over $2,000,000, hence the prosperity of that locality.

H. B. Wagoner's winery at Livermore has finished the season's work. It crushed 1650 tons of grapes, filling 250,000 gallons of cooperage.

Recently 1200 bales of hops were sold at Santa Rosa at 22 cents per pound. The entire crop of Sonoma county has nearly been disposed of.

Prof. G. W. Shaw of the State University says that from analysis made, beets of a high grade can be grown at many points in the Sacramento valley.

Supervisor Mann has put on exhibition at the Chamber of Commerce in Monterey a pumpkin raised on his ranch that weighs 302 pounds.

The cotton boll weevil first came to Texas from Mexico in 1894. The pest is now spreading, and unless checked may ruin all the cotton crops of the South.

Valuable seeds and plants for California growers are now ready for distribution by the agricultural department of the State University. Write Prof. E. J. Wickson for them.

The Legislature of Louisiana is now trying to devise means to destroy the boll weevil pest. This pest damaged the cotton crop of Texas this year to the amount of $50,000,000.

The United States government has commenced irrigation work in Lake county. It is stated that Uncle Sam has $2,000,000 on hand to spend in perfecting irrigation work in this State.

A trade authority estimates the output of canned tomatoes in the United States this year as between 7,000,000 and 8,000,000 cases, considerably less than the 9,000,000 cases put up last year.

Active work has been commenced on the great wheat starch factory at Stockton, heretofore mentioned by the Cultivator. There will be three large building, and it will be ready for business in March. This is the only wheat starch factory west of Chicago.

The Portland Oregonian says there is a large oversupply of Italian prunes, and the market is "flat as a pancake." The fact is, and it may as well be recognized, that the prune trees of the world will produce, one year with another, more prunes than the world will consume except at a very low price.

James Wilson, secretary of agriculture, says this year's corn crop again exceeds 2,000,000,000 bushels. Foreign markets were supplied last year with 3,500,000,000 pounds of American cotton. The value of farm products this year, outside of what was fed to live stock, is nearly $4,000,000,000.

Acting on the suggestion of Prof. Hilgard, as well as the advice of an eastern manufacturer of mattings, the Oakland Board of Trade will go into the cultivation of the tule-grass on a small scale, to demonstrate the fact that Alameda county is well adapted to its cultivation. Most of our mattings come from Japan, where the tule is worth $40 per ton.

C. F. Marlatt of the U. S. department of agriculture, an expert in silk culture, says California will eventually be a great silk producer. Mr. Marlatt and Andrea Sbaroro of the Italian-Swiss colony of Asti, are conferring relative to the proposed establishment of a colony of silk workers for the production of silk on a large scale at Asti, Sonoma county.

HORTICULTURE.

Japanese oranges are now arriving at San Francisco. They are of fine quality.

The Highland Orange Growers' association has been organized, capitalized at $10,000.

It is now claimed that formaldehyde as a preservative of citrus fruits en route will supersede refrigeration.

For the past three weeks a train of 20 cars loaded with oranges from Tulare county has passed through Visalia daily.

The fruit jobbing firms in territory bounded by Chicago, Denver, St. Louis and Winnipeg, are to be joined in one combination.

W. R. Gibson of Woodland has received some shellbark hickory nuts from Missouri and will plant them, hoping to grow the tree here.

Regular tri-weekly auction sales of citrus fruits were inaugurated in San Francisco, December 16. Six or seven carloads of oranges were dispsoed of.

There will be a shortage of orange boxes in San Bernardino county, owing to the late destruction by fire of the sawed lumber in that vicinity.

Ben Thomas of Delano this year grew some oranges that weighed 15 ounces and measured 12¾ inches in circumference.

The shipping season of deciduous fruits of Northern and Central California is ended. There were sent out 7500 carloads, as against 7360 in 1902.

The Santa Rosa Republican says: The fruit dealers' conspiracy at San Francisco must be put down with all possible dispatch.

A. W. Wheeler of Tulare has an orange tree in his yard that bore this year 1000 oranges. One small branch had hanging to it 16.

Harry H. Brown of Naranjo, Tulare county, has a young orange orchard of 80 acres. He gathered his first crop this year. His oranges are of the finest variety.

The fruit packing house of D. H. Paul & Co. of Fresno was destroyed by fire the 17th. Raisins to the value

Coast News and Notes

CONTINUED

of $30,000 were lost. Insured for $22,000.

Capt. William Crosby of the Arroyo Valle, near Livermore, has a superior lot of sun-dried prunes. He uses no dip and the flavor of his fruit is superior to the doctored article.

Pruning of orchards and vineyards in the Sacramento valley has been going on actively the past two weeks. Following this will come tree washing and spraying.

The first work at the Lodi government experimental station will be to ascertain which resistent roots are the best, and which are the best grafts on these roots. Over 60 varieties will be tested.

R. P. Grant this year raised some excellent lemons in his yard in Visalia. Heretofore no especial effort has been made to grow lemons to any extent in that vicinity. It has, however, been proved that they do well there.

At the late Fresno fruit convention it was suggested that the matter of scarcity of help to gather fruit during the summer and autumn could best be met by inducing eastern families to come here and permanently locate.

The orange men of this State insist on a lower shipping rate than $1.25, for when that rate was fixed there were less than 10,000 carloads of oranges shipped by rail annually. This year the shipments will amount to 30,000 cars.

So far the harbor commissioners at San Francisco have revoked the permits of nine wholesale fruit and produce dealers to transact business on the wharf, because they refused to sell to retailers who were not in the combine.

California prune growers have difficulty in getting more than three cents a pound for their fruit, while French prunes sell in Spain for 28 cents per pound. Jerome Hart, who writes about it, says the reason why the French prune sells for so high a price is because they are cultivated, gathered, dried, selected, packed and shipped carefully.

There is a sentiment growing among orchardists that prune growing in California is overdone. The San Francisco Chronicle says: "There are probably as many sugar prune trees now planted or grafted as ought to be put out until the commercial status of that fruit is better settled. Growers may think what they please about a new fruit, but the only real test of its value is the market."

LIVE STOCK.

A show of fat stock is to be held in San Francisco next March.

Six carloads of Eastern poultry arrived at San Francisco last week.

The Stockton hospital farm and dairy product was last year valued at $12,843.

A co-operative creamery is to be established by the farmers of Indian Valley, Plumas county.

The supervisors of Tulare county have abolished the office of county veterinarian in that county.

Waltz & Hale of Pendleton, Oregon, have this year shipped 50,000 sheep at an average price of $1.32 per head.

Mr. T. Knight has brought 14,000 Angora goats from Oregon and put them on his ranch of 1100 acres near Napa.

The poultry market in San Francisco is well supplied for the holidays. Seven or eight carloads of Eastern poultry were received for Christmas.

W. H. Bain of Visalia, who owns one of the largest dairies in the valley, announces that he will sell out to go into other business. Last week he sold 13 fine shorthorn bulls to C. L. Adams.

The Visalia Delta enters into a argument in which it insists that there can be no better place for the pleasant and profitable prosecution of the poultry-raising business than in Tulare county.

Gov. Pardee will appoint delegates to attend the National Live Stock and National Wool Growers' seventh annual convention to be held at Portland, Oregon, January 11 to 15, inclusive.

The Sacramento Union says that during the past five years the counties of Fresno, Tulare and Kings have come to the front as butter producers, but the industry is still in its infancy. Fortunes are yet to be made by the dairymen in California.

State Veterinarian, Dr. Blemer, still insists on keeping a strict quarantine in force in Santa Barbara and San Luis Obispo counties to stamp out the cattle diseases there. The cattle men of those counties have formed a live stock association to fight the disease.

Nine hundred sheep belonging to A. A. Curtis of Okanogan county, Washington, were killed one night by unknown parties. Mr. Curtis charges the outrage against the cattlemen, who claim that sheep use up the pasturage. Mr. Curtis has appealed to the President to protect the sheep men.

The Sonoma County Poultry association have elected the following officers: H. Graff of Petaluma, president; W. H. Creighton of Penngrove, secretary; Mr. Lawson of Novato, treasurer. The other directors are J. F. Hiner and J. W. Waterman. H. D. Pressey of Petaluma was appointed state organizer.

MISCELLANEOUS.

A Farmers' Institute will be held at Florin, January 15 and 16.

The Southern Pacific company will pension 125 employes who will be retired January 1.

Gen. Viljeou of South Africa is looking over Southern California seeking a location for a colony of Boers.

It is given out that white porters alone will be employed in the Union Pacific sleepers and "tipping" will be forbidden.

Traffic Manager Stubbs of the Suthern Pacific says the entire country is suffering from a shortage of freight cars.

Kings county has withdrawn from the joint exhibit plan with Tulare and Kern counties, and by its action has upset all the plans laid.

The French-American Wine Company is preparing to erect another large winery at Healdsburg. They crushed 1300 tons of grapes this fall in their present winery.

Recently ships leaving San Francisco for Japan and China, have carried heavy consignments of flour. Australia and Asia are drawing on this country heavily for breadstuffs.

The steamship "Indrapura" has just brought to this coast from the Orient 40 tons of silk worth $200,000. The silk came from Yokohama, and is the largest importation of silk ever made by single shipment into the West.

The people of Santa Clara county are alarmed over the danger that their fresh water will be appropriated by the water company that supplies San Francisco and Oakland, and have taken legal steps to protect themselves.

There is a surplus of over a million jute bags on hand at the San Quentin prison. Farmers had engaged them and deposited 10 per cent. But not needing them, forfeited the deposit. The prison fund is therefore short $60,000.

For two years the oil consumption of the world has exceeded the production. The stock of crude Pennsylvania petroleum above ground in December, 1900, was 13,174,717 barrels, while in December, 1902, the amount thus stored was only 5,699,127 barrels.

Four thousand independent telephone companies in Illinois, Wisconsin, Kentucky, Missouri, Iowa, Indiana, Pennsylvania, Nebraska, Minnesota, Ohio and Michigan, involving property valued at more than $200,000,000, have been amalgamated.

Yolo county will exhibit at the World's Fair samples of Japanese buckwheat. It was planted August 1 and harvested September 16. It yielded 2146 pounds to the acre. It sells for 2 cents per pound, and is therefore more profitable than barley. It makes a splendid flour.

WANTED—Orange Groves or Orchards to care for. Thorough, experienced hand. Will furnish good team.—J. L. CONRY, CLEARWATER, CALIFORNIA.

C. H. SESSIONS, ASSOCIATE EDITOR

C. H SESSIONS.

C. H. Sessions is more of a doer than he is a writer. His suggestions and helpful ideas have been of value in the columns of the Cultivator, but his private interests have prevented our having as many original articles from him as we would like. Mr. Sessions, with Mr. Platt of Los Angeles, are the owners of the Belle-Vernon Farms Co., which supplies the city of Los Angeles with a large part of its pure milk. The responsibilities of this business keep Mr. Sessions occupied.

BETTER BUTTER ON THE FARM.

"All are agreed," says Dairy and Creamery, "that there should be an improvement in our dairy butter, and that there is a loss on account of inferior quality, many tons selling each year at a low price, even then bringing all it is worth, but not paying the cost of production.

"There has been an improvement during the past few years, not all by any means that there should be, but there are many private dairies making fine butter and putting it up in good shape, and receiving the highest prices for it, but there is still too much low grade butter made.

"In suggesting how our dairy butter may be improved, I would like to first say that some aim should be made to get a more uniform quality. Even in the same section can be found as many different grades as makers. The color, salt, flavor, and package are all different. If we could get our butter dealers and the farmers with wives and daughters interested in a certain system, either by the aid of a traveling dairy or an instructor, meeting together two or three days in one section, giving and receiving instruction, and start from that, all making the same grade, each farmer to put his name on his package and receive for it according to quality, it would raise the standard in that section.

"The proper ripening of cream is one of the foundations for making good butter. A farmer should have a proper utensil to ripen cream in. It is not necessarily an expensive one, but one in which he can regulate the temperature. There are, like the churns, all kinds of places and vessels used, from the crock in the corner near the woodbox to a better contrived plan. In many cases flavors are introduced while the cream is being ripened. Some butter makers try to finish the ripening process in the old churn, letting the age of the churn act as a starter, as it stands near the stove.

"Overripe cream one day, partially ripe another, ripened at a high and low temperature, will not make the same butter even from the same milk; therefore, let each farmer have a place and utensil so that he can ripen the cream the same for each churning.

SELLING SKIM MILK.

The Ottawa (Ill.) Free Trader says that a $15,000,000 corporation headed by L. E. Ingalls of Joliet has organized for the purpose of making common flour from the skimmed milk, thrown away, practically, by the farmers in the neighborhood of the large creameries in Illinois. If there are any farmers in Illinois who are throwing away skim milk in these days of high-priced pork and beef, or who are not realizing as good as 25 to 30 cents a hundred for it, it is due to their consummate ignorance of the best points in their own business. We understand, however, that there are lots of such farmers in Illinois and all other States who will not read nor make themselves intelligent in any other way, on the value of skim milk. Such farmers are easy prey to big corporations. All they will have to do will be to offer them 10 cents a hundred for what is worth three times that amount, and they will get the skim milk. Why shouldn't they?

When farmers will not take pains nor spend 10 cents for knowledge enough to save themselves from $10 worth of waste, why should not big corporations be formed to farm such farmers? Not ten in one hundred of the patrons of Illinois creameries read dairy literature, or have ever taken pains to make themselves intelligent on the nature and value of the product they are dealing with and producing. It is just the same in the great dairy State of New York. How can such men be expected to deal intelligently and in the most profitable manner with the business they have in hand? We are surprised that hundreds of such corporations have not been formed and grown rich out of those farmers years ago.

GERMS IN TEATS.

Although milk is sterile when it is first secreted, it is difficult to obtain sterile milk from the udder, because some germs succeed in finding their way to it even before it is drawn. A few drops of milk are always left in the teat after milking, and the end of the teat remains moist. Germs from the air and bedding quickly plant themselves in this thin layer of milk and rapidly multiply. Those kinds which do not require air find the interior of the teat and milk duct a favorable abode. The milk in the vicinity becomes contaminated by the increase and when not discarded affects the whole milking. The lactic acid of some milk bacteria spread through the whole mess, having begun before the milk was drawn.

DAIRY DON'TS.

Don't feed milk to young calves that is not clean and warm.

Don't think skim milk from a healthy cow, properly fed, will scour your calves.

Don't think you deserve much credit for getting angry when feeding a baby calf.

Don't think you, at its age, would do much better.

Don't think "Do unto others as you wish to be done by" means only folks.

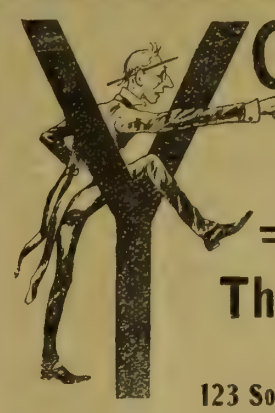
Don't think "He will have judgment without mercy to him who showeth no mercy" has not a broad meaning.

Don't think the Lord doesn't notice how you treat your domestic animals.

Don't think what you believe is more important than what you do.

Don't think there is no "blood in a turnip."

Don't think because roots are nearly all water milk has much less.



You Need Butter Wraps?

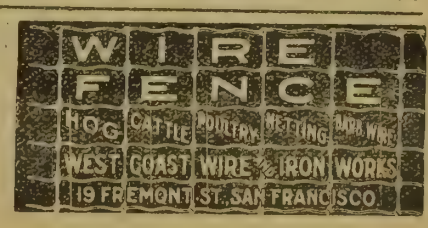
These goods are put up only by the

WEST COAST STOCK FOOD COMPANY

PASADENA, CAL.



Improving Dairy Products.

Prof. W. J. Fraser of the dairy department of the Illinois agricultrural college, has recently prepared a bulletin on the subject, "Dairy Conditions and Suggestions for Their Improvement." As a result of six years' investigation Prof. Fraser says that the dairy condition of the state of Illinois in some particulars are ideal, while in others they are far below the standard. From a sanitary standpoint there is need of improvement in many of the dairy practices, not only in Illinois, but in all parts of the United States.

Prof. Fraser points out that dairy products are not consumed to the extent they would be if their quality was improved. Under existing conditions it is in many places almost if not quite impossible to obtain on the open market any real good butter or cheese. It is pointed out that even at good hotels when milk is ordered dirt is frequently found at the bottom of the vessel if allowed to stand. This is not appetizing, to say the least, and many persons who like milk now use but little on account of the careless manner in which it is produced and the fear that it may contain dirt if not disease germs.

The commercial value of dairy products is determined largely by their flavors and odors. They are usually judged by the smell, which is so extremely delicate that it takes an exceedingly small amount of a substance giving off a bad odor to make the product of low or inferior quality. No food is more susceptible to defects or more subject to contamination than dairy products, and yet the protection of the purity until they reach the consumer is nothing more nor less than cleanliness. This would seem to be a simple matter, yet it is greatly neglected, but when faithfully performed will more than repay the efforts made.

Many people when handling milk seem to forget that they are dealing with food products. There is a tendency for certain unfortunate practices to invade the dairy business. If filth is allowed to get into the milk or if it becomes tainted at any point of its production, no amount of care, either before or after, can make amends for the difficulty. A man may be careful and correct in all his dairy occupations but one, and yet this one may be the cause of his producing a low grade product. This one mistake not only injuries his product, but the dairy market as well. This being true, it is clear that the greatest care should be exercised in every step of production, manufacture, and delivery of dairy products to the consumer. Only those dairymen who exercise such care can hope to secure the trade of people, who desire a product of superior quality and are willing to pay an advanced price.

The real foundation of the whole dairy business lies in the milk product. The chief necessity then, in improving the dairy conditions is to give the producer such a knowledge of the right methods of handling and caring for milk that he will not only see the necessity for such methods, but may also know best how to accomplish the purpose.

TREAT YOUR ANIMALS KINDLY.

A horse with brains don't like to be talked to like a prize-fighter.

Keep a little salt where your animals can get it at pleasure. Don't throw it in the feed.

The same money's worth of mixed feed is more economical than to feed one kind alone.

Don't think because your horse cannot speak he knows nothing. He is usually brainy, and in many cases knows more than his driver.

The chief cause of viciousness in horses is harshness and cruelty. Ignorant, cruel and reckless drivers cause unsoundness, while disease results from damp, cold or foul stables, exposure and improper feeding.

Horse owners were seized with alarm over sixty years ago when steam was recognized as a means of transportation. Since that there has been the electric car, bicycle and horseless wagon scares. All these have come to stay and have the work to perform.

The horse, the grandest of all animals next to man, is also here to stay.

DEHORNING CALVES.

The practice of dehorning cattle is growing, and many claim it has proved a benefit, as not only are the polled animals gentler in temper, and less likely to be dangerous than those with horns, but dairy cows are found better milkers, also. The dehorning of older animals by such means as the saw or the clippers has, however, so much the appearance of cruelty, that many experiments have been made in order to discover a really humane method. One of these has been made at the New Jersey Experiment Station at New Brunswick. The results of these show that the simplest and most humane way of destroying the horns of animals is to prevent them from developing when the animals are young. This can be done by the use of caustic potash, which ean be bought of any druggist in the form of white sticks. The method of applying this is very simple. The hair is clipped away from the young horn, so that the potash may come in direct contact with the parts to be treated. The stick of potash is rolled up in a piece of paper, so as to leave one end open. This open end is slightly moistened and rubbed on the embryo horn for a few seconds, or until the skin begins to start, care being takem that the whole of the border, or matrix, is included in the treatment. Healing soon followed this treatment, and smooth polls resulted in every case. It was found that the best time to apply the treatment was when the calf was from three to ten days old, although the treatment was equally effectual when the calf was eighteen days old.

DOES THIS FIT YOUR COW?

If a boy should come from the heart of a city, says the Baltimore Sun, who had neither seen nor heard of a cow before, how would he describe it as it is seen at this time of the year on many of our Eastern farms? His observations would lead him to say that it was used as a sort of scavenger to keep things picked up about the fields in winter time, to pull the branches off the corn stalks and trim up and bore into the straw piles, and while not at work stands on the leeward side of the stawstacks or in the fence corner with its rudder to the wind. It has a hump similar to a dromedary, only more rounding. It has hair like most other animals, except that it stands up more, and on its flanks it has not hair at all, but scales like an alligator. It doesn't seem at all satisfied with life, but stamps its feet, shakes its head and acts mad.

REGULAR FEEDING.

If the stockman expects to have his stock do well he must feed with regularity. Not only must he feed at the same time each day but he must balance his rations so as to get the best results. Constant diet on one article, or more, of feed, will cause an animal to fall away and eventually to become weak and incapacitated for work. Dry feed constantly used will produce constipation, slow kidney action and a rough coating of hair whereas if alfalfa and some green feed is used, with a weekly bran mash containing a little salt, the horse or cow, or hog, will thrive and the feed given produce the best results.

GATHERED CREAM FROM FARM SEPARATORS AND THE PASTEURIZER.

It is quite evident that the coming evolution of creamery practice is irresistibly toward the separation of creanr on the farm by the use of the farm separator, and the gathering of the same by teams. The compelling cause of this change is the saving of labor and cost in the transportation from the farm to the creamery, and the very greatly increased feeding value of the skim milk. The real foundation of the creamery rests in so conducting the business that the farmer shall get out of it all the value there is in it for him. Certain creamerymen seem to think that they should take the first and largest profit and what is left may go to the farmers. But any creamery enterprise conducted on this basis is sure to be short lived, and the capital invested in it is soon put out of commission. It is for this reason that we believe that the farm separator has come to stay, and all future evolution will be in that direction. If this system is adopted, two things become necessary at once, if the butter to be made is of first-class quality.

1. Systematic effort must be put forth on the part of the creamery to educate the cream producer how to care for his cream in a manner that will result in making the best butter possible. Every creamery has within its power to push such a system of education. All that is necessary is a good understanding, on the part of the butter maker, of the farm and stable conditions of each of his patrons, and good tact, patience and untiring purpose. Before such qualities, the most stubborn ignorance will soon give away.

2. In every gathered cream creamery, the pasteurizer becomes an indispensable part of the machinery. This fact is almost universally recognized in Denmark, the most efficiently organized dairy country in the world.

Instead of blindly fighting the inevitable advent of the farm separator, as some American creamery people are doing it would be more sagacious on their part to clear out the difficulties that lie in the road, and do all that is demanded on their part to make it a success.

The two lines of procedure that we have indicated, will, we believe, end in widely increasing the number of farmers who will become creamery patrons and also greatly improve the butter product.—Hoard's Dairyman.

MILK UTENSILS.

Milk utensils for farm use should be made of metal and have all joints smoothly soldered. Never allow them to become rusty or rough inside.

Do not haul waste products back to the farm in the same cans used for delivering milk. When this is unavoidable, insist that the skim milk or whey tank be kept clean.

Cans used for the return of skim milk or whey should be emptied and cleaned as soon as they arrive at the farm.

Clean all dairy utensils by first thoroughly rinsing them in warm water; then clean inside and out with a brush and hot water in which a cleaning material is dissolved; then rinse and lastly sterilize by boiling water or steam. Use pure water only.

ECONOMY IN FEEDING.

There is no economy in starvation. We feed stock not for the purpose of merely keeping them alive but for the purpose of converting that feed into something of greater intrinsic value. Twenty dollar pieces are a much more convenient medium of exchange than haystacks. And haystacks reach not the full height of their glory till they are converted into gold. Now the longer it takes to produce that transformation the greater the loss of economy. A cow bawling for food is constantly wasting more strength than the owner could afford to let her spare. The miller can expect no flour with no grain in the hopper. Why look for a pail of milk from a bundle of dry bones? We have known men to farm with an old slab-sided team, when a few bushels of oats would have been worth more than a new plow point. There is nothing to be gained by starvation. Of course we are not to overfeed. The economy of feeding comes in through the right use of right material in due quantities.

Well cut feed sprinkled with bran is one source of economy in feeding, providing that the cutting machine can be run without too much expenditure of time. Cut feed will unquestionably go farther than uncut feed. There is little or no waste. To carry out this plan we must have the feeding stable conveniently arranged. The arrangement should be such that the work can be accomplished with the least time and effort. Dispatch has money in it. This is as true in farming as foot racing or railroading.

Feed what the cow will relish and in quantities sufficient for good nourishment and of the kind of material that will produce the best results and economy is assured.

LET THE FORETOP ALONE.

How often one sees the foretop of horses clipped off. Did the one who clipped this appendage ever stop to think of the cruelty he was inflicting on his horse or how it will injure the sale of the horse when he is put upon the market. When at the international show, a horse dealer remarked as a clipped horse was led into the ring: "Horses that are offered in the wholesale markets with foretops trimmed short, clipped and otherwise disfigured, are looked upon by buyers with disfavor, and usually sell at low prices. Foreign buyers will not purchase a horse with its foretop cut off, as they cannot handle such animals to advantage, and home dealers always discriminate against such offerings." When asked the reason for this, he said: "In the summer time when flies are numerous, horses whose foretops have been clipped often get sore eyes because they cannot keep the flies away from their heads and out of their eyes. If the foretop be permitted to grow, the hair will chase away the flies every time the horse shakes his head and you often see teamsters whose horses have been clipped, tie rags to the top of their bridle to take the place of the foretop." Thoughtless people often clip their horses' foretop, not realizing the cruelty they are inflicting upon their faithful friends. The checkrein and the clipped foretop should never be seen on a horse, and the time will soon come when they will not be.

MANAGEMENT AND FEEDING OF THE CALF.

The calf is such an important member of the herd as to merit every attention. On the treatment of the calf until maturity rests the foundation of successful stock raising. The care of the calf should properly begin at the mating of the parent stock, by careful feeding of the dam until the arrival of a healthy well nutured calf are the first steps in successful calf-raising.

The after treatment of the calf depends much on circumstances, and the purposes for which the matured animal will be used. Whether it is better to leave the calf with its mother, or remove at birth, is a matter which many differ in general practice. My experience is in favor of immediate removal, as not only does the cow milk better but the calf, once taught to drink from the pail or to suck the self-feeder, thrives steadily, avoiding that set-back which frequently takes place through fretting and weaning from the dam. If the farmer is selling milk and wishes the highest possible profit from the cows in milk yield, it becomes an important point with him to raise his calves on as little whole milk as possible. After the first week, during which a liberal allowance of whole milk should always be fed, skim milk may in part be substituted. Many use some form of meal as milk substitute made into porridge. But slops are not usually good for digestion and I do not favor them; preferring to feed dry meal as soon as possible. Some time since I used dry blood as a substitute for milk in raising calves with very satisfactory results. I think it quite equal to, if not better, than skim milk, and certainly very superior to meal slops.

The value of dried blood as a cure and prevention in scours is well established. No remedy that I have ever heard of equals it, and I have never known it to fail in checking scours when used in time. As a milk substitute it will no doubt be equally valuable, though so far as I know it has not hitherto been used in this way. I began to use a small quantity of dried blood when the calves were two weeks old, dissolving first in cold water, then adding warm water with which was mixed the calf's allowance of whole milk, gradually I reduced the allowance of whole milk, increasing the quantity of dissolved dried blood in proportion until at three to four weeks old a calf's allowance of whole milk did not exceed 2 or 3 pounds. Of course there was an allowance of dry grain. These calves grew quite as well as those on a full allowance of whole milk anl appeared in equally good condition throughout their after periods of growth on pasture. I should add that pure water was supplied regularly, and it is most important dried blood can be safely used in this way, I am not prepared to say, calves from the start. To what extent dried blood can be safely used in this way, I am not prepared to say, but so far my experience gives confidence in advising its use.

In feeding calves one cannot be too careful to have everything in perfect order. Punctuality in feeding and absolute cleanliness of utensils and quarters are of first importance. Surely unsanitary quarters and carelessness with the feeding pail are among the chief causes of disease. The liquid food such as milk or its substitute, should never be fed cold or sour, but always at the same temperature. Careful watch should be kept on the digestion and the first signs of derangement attended to, as if overlooked, the calf may soon reach a state past recovery. For housing calves, where possible, the best plan is to have single pens. In this way the injurious habit of suching each other's ears, etc., causing flatulency anl upsetting the digestion, is avoided, besides being more convenient for feeding. Patent feeders are probably better than the pail, as the calf gets the milk too quickly from the pail and does not appear so well satisfied as when sucking more slowly from the feeder. To raise stock successfully, it is of the utmost importance to give liberal treatment to the calves, keeping up the natural growth until maturity is reach. It is doubtless practicable to bring back into good condition a fully-matured but lean animal; but let young, immature stock lapse into an unthrifty condition, and it will be found impossible successfully to start the growth again.—A. Williams, Country Gentleman.

Cutter's Black Leg Vaccine

California Stockmen's Favorite

Used by 80 per cent of vaccinating stockmen in California. Early vaccination is good insurance. Write for description of our Black Leg Pills and Injector for using them. They are safer and easier used than either the string or powder vaccine.

F. M. HOTALING

Rialto Building San Francisco, Cal

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

MRS. A. BASLEY.

Mrs. A. Basley has been in the Cultivator a little over a year, but in that time she has made a name for herself as a writer of practical poultry information which has won for her many friends in this state. While she may be called a poultry fancier, yet her fancy is to utility breeds and in producing a money-making strain of poultry. In this she succeeded, as she has in writing. While she has recently disposed of her White Plume Poultry, we hope to be able to keep her for some articles during the coming year. She has a faculty of placing a great deal of information in a homely instructive way which makes her page one of the first sought for by many readers.

Christmas is here with its sweet, sad memories, and with all its peace, good will and joyful times.

"Grandma," said a cheerful little voice, "the rooster is saying 'I wish you a merry Chris-mas!' Now listen to him." And the little voice crowed it over in the rooster's tones till we all laughed and confessed it sounded very much like 'I wish you a merry Christmas.'

So today I begin my article with the words of the rooster, and wish all my readers a very merry Christmas and happy New Year.

* * *

A year seems a short time to look back, but a long time in looking forward. However, in the year that has passed the Cultivator has made many friends, its circulation has nearly doubled, and I see a great future, not only before the Cultivator, but before the whole State of California; and if California prospers this paper will do so.

When I was first invited to become a contributor for the poultry department of this paper, the largest broiler raiser in Pasadena said: "I am glad you will write for the paper, because you have studied the climatic conditions of this State and will give valuable information about raising chickens and producing eggs under climatic conditions directly at variance with those in the East."

Now, this is not only true of the poultry department, for all the other associate contributors are experts in their own departments, and they all deal with Pacific Coast conditions. People coming to California to live find a climate, soil, and many other conditions entirely different from those to which they have been accustomed back East, and unless they have someone to instruct them what to do, what trees, shrubs, vegetables, plants, vines, etc., to plant and how to care for them, how to fight the various pests, how to care for cows, horses, swine, fowls, in this climate they will have to learn by costly experience. The California Cultivator, costing only a dollar a year, will give them all the knowledge they want; in fact, as I have said to many newcomers to this climate, it is an absolute necessity for you to take the California Cultivator.

However, I fear I am intruding on the editor's province, so I will retire into my eggshell again and only speak of poultry.

* * *

During the past year I have written on many subjects of the various breeds of fowls. I have kept 13 varieties: of ducks I have kept 6 varieties, of turkeys 4, of guineas 2. I have written of the various branches of the poultry business, and in everything I have given very simply my own experiences, some of which have cost me much. My aim has been to help especially my sisters in the poultry yard. On account of the health of my daughter and her baby, I have sold off my poultry, only keeping the one cheerful rooster that is wishing me a merry Christmas and his dozen young wives. This will give me more time with my pencil, and I shall gladly continue to answer questions through the Cultivator. Also, as we have a very large number of new subscribers, I will be glad to rewrite some of my articles on bringing up young chicks, ducklings, turkeys, etc., and my plan of mating for eggs, feeding for eggs, etc.

I have made such a great success of the poultry business that I feel sorry to give it up, but shall be more than glad if I can help others to succeed.

* * *

TURKEYS.

The turkey should be, of all others, the topic of thought with poultry raisers and breeders at this season of the year. With turkeys retailing at from 28c to 30c a pound, none but the rich deserve the fare at Christmas time. "Grandma, the big white gobbler doesn't say 'Wish you a merry Christmas,' so will you kill him for Christmas dinner?" "Well, Harold, the white gobbler weighs over 20 pounds; how much would that come to at 30 cents a pound?" "Why, that would be 600 cents, Grandma; you might call it six dollars. My! but that would cost a lot!" So, after a little consultation a white hen turkey was decided upon.

* * *

A neighbor of mine for many years has raised over a hundred turkeys for Thanksgiving and Christmas and has netted over $200 every year.

Turkey raising here is not difficult if you only know how; they require but little more care than chickens and are such dear, tame, inquisitive little things, it is a real pleasure to handle them. Later on I will give full directions for mating, breeding and raising turkeys in California and guarantee anyone following my directions will have absolute success.

I met a man driving on the road last week with a wagon load of nice turkeys averaging 15 pounds each. I asked him the price, and learned that he was getting from 28c to 30c a pound. He said he had 20 left. He also remarked that his neighbors had not been able to raise any, because they did not know how. They only had the old ones left. It is all in the knowing how to do anything, and then doing it. And with this I wish you all a very merry Christmas.

FEEDING.

The proper way to feed breeding stock is to be very careful and not over-fatten them. The principal food from the time of selection up until the hen commences to lay should be oats. During the very cold weather feed a little ground corn at night. Alfalfa is very good. A head of cabbage is greatly relished by them and should be given often during the cold months. Ground charcoal is necessary for turkeys, the coarser the better. Oyster shells supply lime, otherwise the shell of the egg will be very porous, and many of the germs will die on this account.

LAYING.

The turkeys begin laying quite early in spring often before danger from freezing is over. If you wish them to lay near by, supply nests for them. A nest thirty-six inches square on ground free from danger of flooding during rain, and located in some quiet place is a great inducement. A small pen will serve the purpose as well. Remove the eggs every evening and date them, then place each with little end down in bran, and the receptacle in a cellar or any other cool place, and for two or three days afterward turn every day. It would be safe to keep them ten or twelve days but no longer. Replace each egg with one of glass, and carefully cover with leaves as the hen does, otherwise when she comes back to lay, as a rule she will desert the nest. A hen will lay twenty-five to forty eggs during the season.

POULTRY NOTES.

water is good far scaly legs.

Confinement and inertness generate vicious habits and they are feather picking and egg eating.

The hen ceases to lay when improperly fed or when in a diseased condition.

During the winter one of the best foods that can be given the hens is finely cut, scalded clover hay.

Most grains are deficient in lime and mineral matter, but bran is rich in nitrogen, carbon and mineral matter.

If the fowls have been diseased, change the food every day or two and change the grit.

Scattered seed from hay, millet, hungarian, sun fiflower and even weeds are excellent as a variety.

It is a good plan to have two sets of roosting poles for the hens, changing them every week.

The first egg laid by a hen is the most expensive and each additional egg assists in lessening the cost of the whole.

100 S. C. White Leghorn Pullets, the pick from 300 beauties mated to two-year-old roosters that cannot be beat. Eggs $1.50 per 15; $5.00 per hundred. M. L. CURTIS, Los Soso Poultry Farm, San Luis Obispo, Cal.

SHOEMAKER'S BOOK ON POULTRY

and ALMANAC for 1904
There is nothing in the world like it. It contains the following: 212 large pages, handsomely illustrated. A number of most beautifully colored plates, true to life. It tells all about all kinds of Thoroughbred Fowls, with life-like illustrations and prices of same. It tells how to raise poultry successfully and how to treat all diseases common among them. It gives working plans and illustrations of convenient Poultry Houses. It tells all about INCUBATORS and BROODERS. It gives full instructions for operating all kinds of Incubators. This chapter is marvelously complete and is worth dollars to anyone using an incubator. It gives descriptions and prices of Incubators, Brooders, and all kinds of Poultry Supplies. In fact, it is an encyclopedia of chickendom and will be mailed to anyone on receipt of only 15 cents. Your money refunded, if not pleased. Address
C. C. SHOEMAKER, Box 718, - Freeport, Ill.

Albers' Black Minorcas

Have the best show record of any strain west of the Mississippi River. They are unsurpassed in vigor, egg production and breeding by any strain of any breed anywhere.

Old and young stock for exhibition or breeding at reasonable prices. Circular and show record free.

508 SACRAMENTO ST. SAN FRANCISCO. CAL.

WET WEATHER POULTRY.

It would seem that ducklings would thrive in wet weather, but they don't. Even the water fowls thrive better if there is some sunshine. It is a great deal more so with chicks; health and growth do not go partners with damp, sour coops and continuous cloudy, cool weather.

When we come to think of it, sunshine is necessary to all life, whether animal or vegetable, and without it for a considerable length of time it shows for itself. There is something about sunshine that is very different from all other kinds of heat.

I have noticed this in poultry raising for a long time, live stock men notice it, in the green house, perhaps, they more fully appreciate it.

While camping out in the mountains this past summer I got a new and very practical lesson on sunshine. The nights and mornings were cool, the camp stove was sufficient to keep us warm, but we soon discovered that there was a balm in sunshine; it was so much more comfortable and bracing to get out in the sun.

While enjoying a sun bath one morning, it occurred to me that the new crop of chicks, back east, must be having a hard time. Cold, cloudy weather, rain after rain, damp, sour, coops, lice, mites, chiggers, etc. While it is impossible to stop the rain or make sunshine, it is not impossible to clean out the coops, to hoist them up out of the mud and kill off the parasites, put in some dry chaff or something of that nature and give the chicks some chance for their existence.

We can go still further and thin out the bunches of chicks, piled up here and there in corners. Everything goes to show that the trouble or bad luck attending raising chicks is mostly with ourselves. More care would mean greater success.

At the San Francisco poultry show there were 50 ducks, representing nine varieties. At the Los Angeles poultry show there were 25 ducks, among them Pekins, Aylesburys, Rouens, Cayugas, Indian Runners, Muscovies, Grey Calls and Blue Swedish ducks. The fine appearance of these ducks brought out many expressions of kindly appreciation. James Hague of Oakland had an especially inviting collection of ducks.

It is not necessary to keep cocks unless the eggs are intended for hatching. The hens will lay just as well, perhaps better.

To increase egg production put a few ears of corn in an oven and reduce to charcoal and feed two or three times a week.

Small eggs from immature pullets, misshapen eggs, extra large eggs and eggs covered with filth should never go in the incubator to hatch.

The capon has ever been esteemed one of the greatest delicacies, preserving the flavor and tenderness of chickens with the juicy maturity of age.

Fowls do not run together in large numbers, it is not natural. They will always divide into flocks of smaller size if given the opportunity and select different feeding grounds. Fifty is as large a number as should be kept in one house together.

It is not a good plan to raise several varieties of fowls unless so situated that they can be kept from mixing. Pure breeds if allowed to run together and mix without control, tend to reproduce a scrub from which they were formerly evolved.

There is no difference in any respect between chicks hatched under hens and those hatched in incubators. If there would be a difference, it would be due to the kind of food and management. All the incubator does is to get the chick out of the shell, a hen will do the same thing for a duckling, yet the duckling does not become a chicken.

In sending dressed poultry to market it is very important to have it thoroughly cooled before picking and yet care should be taken not to allow it to freeze. A good plan after dressing is to hang up in a cool place and yet warm enough to prevent freezing, until thoroughly cold, and then pick. It is very important if the best prices are realized that the fowls when placed on market present a neat, plump appearance.

THE COLLEGE AND THE FARMER

The farmer has not always accepted the idea of agricultural education with grace. Economical methods were not necessary to a certain sort of success a few years ago. Industry was without system, specalization was unknown. But all this has greatly changed during the last decade and the change will be complete in less than another decade. Professor L. H. Bailey says on this point:

"Nothing is more evident in the new place that agriculture is taking in our civilization than the fact that the colleges and experiment stations are rapidly becoming its leaders; a remarkable company of competent men is adding knowledge, resourcefulness and dignity to it. The teacher of agriculture is no longer a book farmer. The old academic way of teaching agriculture is passing forever."

Some one once asked Reynolds, the celebrated artist, how to mix paints to produce his beautiful colors. He answered: "Mix them with brains.' And that is the way to make farming a success. The most remarkable forward movement today in the educational world is the one which has for its aim and end the training of men and women for the American farm. Agriculture is now recognized as a science, and the art of it has been transformed and uplifted through invention, until the drudgery commonly associated with farm life has been forved out of it.

The importance of this forward movement will not be overestimated, when we consider that fully one-half of our population is directly relateu to agriculture in some of its branches, while the entire population is dependent upon its success in producing the world's provender."

The California Promotion Committee is agitating the proposition to build in San Francisco a monster coliseum that will seat 20,000 people, where live stock exhibitors, horse shows, etc., may be held.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

ERNEST BRAUNTON.

Ernest Braunton bears no resemblance to Oscar Wilde, yet he is the apostle of beauty, and through his articles in the Cultivator, we believe that many a home-place in California today is more attractive and home-like. Mr. Braunton is an authority on flowers and their culture and understands landscape gardening so as to give suggestions which will aid in the placing of a beautiful plant where it may not have the impression of ugliness.

Mr. Braunton was formerly editor of the California Floriculturist, was a contributor to Bailey's Cyclopedia of American Horticulture, and has contributed articels in Country Life in America and other exclusive publications.

MAKE YOUR WANTS KNOWN.

Now that the Cultivator's subscription list has passed the ten thousand mark, this department should be overrun with inquiries. The Ladies' Home Journal, by careful inquiry, found that at least seven persons read every number they issued, but, taking five as a fair basis, every issue of this paper is read by fifty thousand persons, and the list is growing rapidly. Is it not fair to presume that one in every ten is interested in gardening? We make an earnest endeavor to answer fully and faithfully every question sent; let us hear from those five thousand "gardeners" during 1904.

* * *

COFFEE PLANTS.

Editor Cultivator: Can coffee be successfully grown in California; if so please give cultural directions, soil, etc. —A. H. L., Riverside.

Coffee as a commercial crop will never be a success in this state, as the temperature falls too low in winter. In sheltered spots, however, the plants may be planted and grown merely as curiosities, with some success. The writer has had plants of both Arabian and Liberian coffee successfully pass through several winters in Los Angeles.

* * *

STORING DAHLIA AND OTHER ROOTS.

Roots of Cannas, Colocasia (Elephant Ears), Dahlias, etc., should be taken up and stored, in case they are needed elsewhere next year or have not been moved during the past three years. Keep them out of the ground until April. Clumps of Cypress and Papyrus which need moving or dividing should be lifted with considerable around them, buried in damp sand or soil and gradually dried off and kept for April planting. This enforced rest will make them respond grandly. When putting away Dahlia roots, label them for height and color, if possible, so that another year you may plant more intelligently.

* * *

MAKE ROSE CUTTINGS NOW.

Now is the very best time to put in rose cuttings. Choose the north side of a building or hedge where protected from winds. Get sand, if possible, if not, any soil not containing too much decaying vegetable matter will do. Take cuttings from long, vigorous last year's dormant growth not smaller than a lead pencil. Avoid using those long, smooth bright-green growths which are not yet hard wood, but full of soft pith. Cut up this wood four to six inches long, making a smooth cut with a very sharp knife, a quarter of an inch below an eye or bud. Make a hole in sand or soil for cutting with a stick larger than cutting, insert cuttings, press soil around them firmly and water well. Do not water oftener than is needed, yet never allow soil to get dry. Do not keep too light, as light produces tops—we want roots—they will grow in the dark.

* * *

FLORAL CALENDAR FOR JANUARY.

Those who have bulbs of Anemones, Hyacinths, Ixias, Lilies, Narcissus, Ranunculus, Sparaxis and Tulips yet unplanted, should put them in the ground at once. If a handful of sharp sand is placed in the holes for each bulb to set on, it will ensure success in many cases where failure would otherwise result. Soak bulbs of anemones and ranunculus a few hours before planting.

For early blooming, seeds of the following may be planted, especially during the latter part of month: Arctolis (a grand annual and too little known); asters, Dianthus (pinks), phlox, salvias, stocks, sweet peas. The latter should be sown once a month if you have room for a precession of these popular flowers.

* * *

VEGETABLE CALENDAR FOR JANUARY.

The planting of vegetables will be on the increase now for several months, the lowest ebb being reached during the present month, while the period of greatest activity is during March and April. If we have heavy rains, followed by several severe frosts during the first part of January, it will be safe to plant many things during the period from 15th to 30th that are not in the following list:

Sow seeds of: Beets, beans, broad and bush varieties, not pole beans; cabbage, early; carrot, cauliflower (our favorite flower); lettuce, parsnip, peas, radish, spinach, tomato.

Plant sets, roots, or plants of: Asparagus, horseradish, onions, rhubarb.

If warm the latter part of the month in sheltered or favored localities early potatoes may be planted.

AFTER THE HARVEST.

The Honey Should Be Removed as Soon as Possible.

A. H. Duff: It is best to remove all good, marketable honey immediately after the honey harvest, for it will then retain its beautiful whiteness, which, if left very long on the hive, it will lose. Comb honey, in particular, will readily lose its good-looking qualities, but, of course, it does not matter with the extracted, except that it is best to extract at once all that is to be taken this way. It is poor policy to extract too close, but far better to lay away a number of frames of sealed honey for the use of the bees. These may be left on the hives in the upper stories until during autumn, when needed. We do not think there is anything to be gained by taking away too much honey from the hives, and feeding instead for winter supply. It may do well enough if we feed liberally enough, but we are apt to do this not just as we should.

All completed sections should be removed from the supers, and those not completed may be crated together and placed back on the hives. There may be some light honey flows during autumn which will enable the bees to complete a number of these sections, and at any rate they will keep as well or better on the hives until the beginning of winter, or some time previous to this, when the bees are arranged for winter quarters.

Bring up the late swarms or nucleus that is intended to make full colonies by giving them frames of brood from the strongest colonies, and also honey if they need it. Swarms without a hive full of combs at this time are but little account, even if on foundation comb, for such colonies will not be in shape to winter unless there is a good fall flow of honey, or the bees well fed. Do not let any colony remain long without a queen, and at this time we will doubtless find colonies without queens, especially if there has been much swarming, for very frequently colonies left with virgin queens often lose them.

The Walnut Industry in Mountain View.....

BY P. F. COGSWELL, EL MONTE

Commencing where the Lexington wash diverges from the San Gabriel river, about three miles northeast of El Monte, and extending southward between the streams, lies a tract of land about four miles long and one and a half miles wide. It consists for the most part of what is known as "Fresno sandy loam." The soil is from 20 to 40 feet in depth, underlaid with water-bearing gravel of unknown depth, and an inexhaustible supply of water. This is what is known as the Mountain View walnut district. Up to 1888 this land was devoted to barley, with some corn, potatoes and alfalfa in wet years.

About one hundred acres were planted to walnuts in 1888 by the late B. F. Maxson, who may be called the father of the walnut industry at El Monte, and H. Ferris and the writer. Since then the acreage has increased year by year, until now there are about two thousand acres in walnuts, about one-third of which are in good bearing. During the first few years corn, pumpkins, potatoes and other crops were raised between the trees. Then came the dry years following 1894, and two pumping plants were put in, one by Mr. J. S. Killian, and the other by the writer. These were so successful that others soon followed, until now there are twenty-five wells, supplying from one hundred to one hundred and fifty inches of water each, sufficient, if it were properly distribued, to irrigate three times the amount of land there is in the district.

* * *

About six years ago the blight first appeared in the orchards here. It did considerable damage, a good many nuts being black on the ends and the kernels worthless. Since then there has been very little upon the nuts, but there has been some upon the trees, especially young orchards and nursery stock, showing as a black spot upon the bark of the new growth. This year a good many nuts dropped off during the summer. Some had a black spot upon the end, but many had no visible defect whatever. In this way we lost probably five per cent of the crop that had set upon the trees.

By far the greatest loss this year was caused by a heavy and continuous rain that came just after the catkins appeared and before many of the young nuts were sufficiently developed to be fertilized by the pollen from the catkins. The third day after the rain the ground beneath the trees was strewn with the blackened catkins. Very few were left to fertilize the nuts that developed later and which, consequently, afterwards dropped off. This loss has been estimated at about fifty per cent of the crop. Notwithstanding these unfavorable conditions the output this year was about 25 cars, which brought over $65,000.

With a normal yield next year this district will produce about 60 car loads of ten tons each.

All of the walnuts in the district except about two cars are marketed through the medium of the Mountain View Walnut Growers' Association, which was incorporated in 1896, and which has controlled practically all of the crop in the district.

* * *

With the exception of the possibility of the blight becoming more serious in the future than it has been in the past, the industry in this locality seems to have as few drawbacks as any branch of horticulture and less than most. While the blight has hovered like a bird of ill-omen over many of the walnut growing sections of Southern California, it has seldom affected this section.

* * *

Modern science and modern inventive genius have circumvented Jack Frost in his stealthy attacks upon the orange groves; they have cleaned out the cottony cushion scale, which once threatened to destroy the orange industry of the state, and have kept in check the red and purple scale, and if the walnut blight ever becomes a serious menace to our growers some remedy will be found for it, if nature herself does not provide one.

* * *

If any one desires confirmation of the optimistic views held by our people, he has only to take a drive through the valley with one of our real estate agents. He will speedily find that not many of our orchards can be purchased for the amount of this year's taxes upon them. We have set up our Lares and Penates under our spreading trees and thus far no one has been found sacriligious enough to remove their household gods from beneath their grateful shade.

FRIENDLY INSECTS.

(Continued from first page)

friendly insects in previous papers and the only excuse I now give for taking up your valuable time was because of a remark, or question, asked by one of our best entomologists some time ago at a meeting of fruit growers and farmers. The question was in substance, "Do you know of any benefit derived from beneficial insects outside of the Vedalia cardinalis?" Evidently the fruit growers present at that meeting had forgotten some of their past experiences with fruit tree pests, for no response was made. State Horticultural Commissioner Cooper is still making determined efforts to introduce other friendly insects that will be of incalculable value to the fruit growers of California.

In 1900, according to the census, the value of farm products in the United States was $4,739,118. This year their value is estimated at $5,000,000,000. The farmers of this country employ over 9,000,000 persons and pay out in wages over $300,000,000.

On the 5th instant, a deal was consummated whereby the Western Pacific Company became the owner of the San Franciso Terminal and Ferry Company. This is understood to be in the interest of the Gould transcontinental railway reaching for the Pacific Coast.

The co-operative idea is gaining ground among the churches. Rev. H. A. Luckenbask, of Oakland, proposes that the Congregationalists, Baptists, Methodists and United Brethren denominations, shall form themselves into a co-operative union, and his suggestion, at a late meeting of the Ministers' Association, had several supporters.

Small Potatoes

result from a lack of

Potash

in the soil. Potash produces size and quality.

We have valuable books which explain more fully the fertilizing value of Potash. We will send them free to any farmer who writes for them.

GERMAN KALI WORKS,
93 Nassau St., New York.

Meyer Wilson & Co., San Francisco, Cal., are so e agents for the Pacifi Coast.

At a late term of court in Merced several doctors were expert witnesses. They got together and put in a claim of $50 per day each. The supervisors refuse to allow the claim, as farmers and bookkeepers, and machinists and common people, are allowed for like testimony but $1.50 or $2 per day. The supervisors ask why, then, should doctors receive $50?

Arizona Statehood.—There is no present prospect that the bill before Congress admitting Arizona to statehood will be passed this session. Arizona people have cooled considerably in their enthusiasm to become a part of the Union, presumably feeling that they are doing well enough as matters now stand. One serious objection is the coupling of New Mexico with Arizona, in the bill.

PERFECT GROWN CITRUS TREES

The cut to the left shows a budded citrus tree as grown in the San Dimas Citrus Nurseries, showing a perfectly shaped head to make a first-class and profitable tree when planted out. It is a one-year-old bud, affording a splendid object lesson of the superior orange and lemon trees we are now offering. Our monograph on "Citrus Culture,"—finely illustrated—tells all about planting and care of orange and lemon trees. If you will write we will be pleased so send you one.

CHRISTMAS BELLS.

Dear are the sounds of the Christmas chimes
In the land of the ivied towers,
And they welcome the dearest of festival times
In this Western world of ours.
Bright on the holly and mistletoe bough
The English firelight falls,
And bright are the wreathed evergreens now
That gladden our own home walls.
And hark! the first sweet note that tells
The welcome of the Christmas bells.

They are ringing tonight through the Norway firs,
And across the Swedish fells,
And the Cuban palm-tree dreamily stirs
To the sound of those Christmas bells!
They ring where the Indian Ganges rolls
Its flood through the rice-fields wide:
They swell the far hymns of the Laps and Poles
To the praise of the Crucified.
Sweeter than tones of the ocean's shells
Mingle the chimes of the Christmas bells.

The years come not back that have circled away
With the past of the Eastern land,
When He plucked the corn on the Sabbath day,
And healed the withered hand;
But the bells shall join in a joyous chime
For the One who walked the sea,
And ring again for the better time
Of the Christ that is to be:
Then ring! for the earth's best promise dwells,
In ye, O joyous prophet bells!

—Unidentified.

KITTIE AND FRANK'S CHRISTMAS AT SEA.

Kittie and Frank had always been used to a Christmas with a Christmas tree and stockings "hung by the chimney with care," and cold weather, with perhaps snow, and a chance for a sled-ride. But the year they were nine and five years old, they had the most unusual kind of Christmas. They were on a big sailing vessel, miles and miles away from any land; there was no possibility of getting a tree. Santa Claus and his deer would surely have drowned if they had tried to reach them, and, besides, there was really no chimney fit for him to come down. There were not even any stores where there would be a chance to help Santa Claus hunt up his supplies. And the weather was hot,—oh, so hot! Kittie and Frank had not dared to go out in the sunshine for several days.

But when Christmas Eve came, they hung their stockings by their berths (Kittie's berth was right over Frank's), and they whispered a good while, wondering how anything could be put in them, and they dropped asleep more than half afraid they would find them still empty in the morning.

While they sleep, we will take a look at the other people on the ship. There were not very many, only the children's father and one other passenger, a young man, besides the kind old captain, the mates, sailors, and the cook. But there were a number of animals. The Captain had a pink-and-gray parrot, which came from away over in China, where some one who spoke "pigeon English" had taught it to say "Polly wants chow-chow." Then there were two monkeys, some white cockatoos, some chickens and ducks, and three big black pigs. But the best of all was a tiny deer, which came from Java. It was full grown, but hardly any larger than a fox-terrier. You can image how cunning it was, with its tiny little hoofs that pattered about the deck.

The sun had hardly begun to send his first messengers up from the edge of the water when Kittie and Frank opened their eyes, and began feeling for their stockings; and how they shouted when they found them full,—yes, full to overflowing—and Kittie's had a package tied on the outside of the toe.

Kittie climbed into Frank's berth, and they sat tailor-fashion as they opened their treasures. Each took out a package neatly tied, one marked "Kittie, from the chickens," and one "Frank, from the monkeys," and each with the words "Wishing you a "Merry Christmas."

Quickly they untied the strings, not saying a word in their eagerness, and found, when the first paper came off, there was another inside, and, when, it came off, another inside of it, and still another, and another, until their faces began to grow solemn with the dreadful thought that maybe there was nothing but paper, after all. But no. Frank gave a squeal of delight. The monkeys had sent him what they loved best,—a banana, and , in another minute, Kittie found some rice from the chickens; and the monkeys gave Kittie a big lump of brown sugar, and there were crackers from Poll Parrot, and corn from the pigs, and sweet potatoes from the little deer, and seed from the cockatoos, and a tiny bottle of fresh water from the ducks. Each had given of his own best store. Then there were some bright pieces of money from some of the grown people, and the bundle on the outside of Kittie's stockings contained a little book of Longfellow's poems, on the fly-leaf of which was written under the names: Christmas, 18—Ship "Etta Loring." Therm. 82degs. Lat. 5 degs. 35 min So.; Lon. 24 degs. 30 min. W.

So, if you will look on your maps, you can find exactly where all this story happened.

About eleven o'clock in the morning, the cook sent for the children, and said that early that day, almost before light,

Santa Claus Was Good to Us.

he had heard a strange little voice calling his name, and on following the sound, and looking over the rail into the ocean, he saw a tiny gray-haired man, who called for a rope to be thrown to him. This the cook did, and pulled the little fellow on deck, where he stood dripping and shivering so that his teeth chattered, and he begged to be allowed to get in the oven to dry and warm himself. The cook said "Yes," so in he crawled and shut the door, and the cook went about his work. An hour or so later, the cook suddenly remembered the little man, and rushed to the oven fearing to find him burned to a crisp, but he had gone. In his place, he had left a nice round cake, with a straight line of icing down the middle, and Kittie's name on one side and Frank's on the other.

When the children had heard all the story and admired the cake, the cook cut it exactly by the straight line, and each took a half and began to eat. Pretty soon Frank's teeth came to something so hard that he could not bite it, and he said, "Mine has a bone in it." But, when he looked, he found a bright ten-cent piece, and soon Kittie found one in hers.

When they had finished eating, they hugged the cook,—real bear-hugs,—and thanked him, although he insisted that he had nothing to do with the cake, and the wee man of the ocean had left it.

Now, you can believe the cook's story or not, as you like, but the rest is a true account of a Christmas far out on the big rolling sea.—Eleanor Scott in the S. S. Times.

A "LOST" CHRISTMAS GIFT.

At the approach of the first Christmas after the wedding, a certain bride, desirous of giving her best beloved something made by her own affectionate but inexperienced hands, manufactured a truly wonderful nightshirt of more than ordinary gorgeousouting flannel, trimmed with lace-edged ruffles, and was further embellished with rows of elaborate feather-stitching.

The surprised husband expressed a proper amount of gratitude, and said —with truth—that he had never beheld a garment to compare with it; but when asked later why he did not wear it, he replied that it was

"Far too good
For human nature's daily food."

and that he was saving it for some occasion that really demanded a nightshirt of more than ordinary gorgeousness. It was just the thing, he averred, to wear if one happened to be convalescing from a broken limb or a long attack of fever.

But one day the husband telephoned that he was unexpectedly called out of town on business, and requested his wife to pack his valise and to have it at the station within the hour, which she did.

Feeling tired after a long day's ride, and having nothing better to occupy his time, the man went to his room at nine o'clock that night, intending to go at once to bed. When he unpacked his valise he discovered that the long-dreaded "special occasion" had at last arrived, for there, folded neatly in the valise, was the pink-and-white nightshirt—ribbons, ruffles and all.

The traveler was slightly bald, he wore a sandy mustache, and when he had tied the broad pink ribbons in a bow under his decidedly masculine chin, he made a picture never to be forgotten. He was just about to climb into bed, hoping fervently that no sudden alarm of fire would render it necessary for him to appear unexpectedly in public, when he was startled by a loud rapping at his door.

Supposing his visitor to be the bearer of an unexpected telegram, he opened the door to find himself confronted by the last person he wanted to see—or to be seen by—in the circumstances. His caller, a man upon whom, for business reasons, he was desirous of making a good impression, had discovered his name on the hotel register.

"Good gracious!" exclaimed the astonished visitor, "are you on your way to a fancy-dress ball?""

"No," returned the embarrassed victim. "I'm merely getting ready to go to bed in the nightshirt that my wife made me for Christmas."

The young wife subsequently considered it strange that her husband was never afterward able to recall the name of the town in which he absentmindedly left that unexampled nightshirt under the hotel pillow.

"There were seven yards of lace on it, too,'" she would sometimes sigh, regretfully, "and four yards of ribbon; but never mind, dear, I'll make you another sometime."—Youth's Companion.

A CALIFORNIA CHRISTMAS CAROL.

From behind the upraised fingers of our mother range the storm tiptoed, thinking to surprise the valley. There came a soft wind from the sea and whispered a word in the ear of the storm. At the word its cold heart melted. The dread of all the east land was born again according to the Scripture of this coast. It ceased its war songs and sang love ditties. It cut the leashes of its snow shoes and tossed them back, descending the hills in its stocking feet. It laughed softly, and then tinkling trills rang down the canyon, like the ripple and splash of waterfalls.

From the chaparral there came reply. It emanated from the top of a scrub oak; first a warble of welcome, then a love song as from a joy-breaking heart, then a note of triumph as when a danger is past, and then a lullaby tender and low. Then the voice rose again as if summoning the wild rose, and the helitrope, and the cream cups and the daises and poppies to a mid-winter carnival on the uplands. Then came the rehearsal of a Christmas carol. From that single throat on the apex of the scrub oak came notes from all the birds of the foothills, the hermit thrush, the canyon wren, the wood pewee, the Audubon warbler, the song sparrow, the mountain blue bird, and a host of others, until the clear air was thrashed with melody heard nowhere else save from the chaparral-covered bed of a one-time mountain torrent.—Elizabeth Grinnell, in Sunset Magazine.

In some parts of Germany each family places a sheaf of grain on a high pole on Christmas day for the birds.

Bad grocer confesses his badness by selling bad lamp-chimneys.

A CHRISTMAS CAROL.

They tell a lovely story, in lands beyond the sea,
How, when the King of Glory lay on His mother's knee,
Before the Prophet princes came, bringing gifts in hand,
The dumb beasts felt the miracle men could not understand!

The gentle, patient donkey, and the ox that trod the corn,
Knelt down beside the manger, and knew that Christ was born,
And so they say in Sweden, at twelve each Christmas night,
The dumb beasts kneel to worship, and see the Christmas light!

This fancy makes men kinder to creatures needing care;
They give them Christmas greeting and dainty Christmas fare;
The cat and dog sup gaily, and a sheaf of golden corn
Is raised above the roof-tree for the birds on Christmas morn.

—Mary Field Williams.

WHAT TO DO FOR THE BOY.

The boy is a problem and a promise. As we study the problem we are impressed with its greatness, but if we bring to our study heart and conscience, as well as intelligence, we cannot fail to help the boy in the fulfillment of the highest promise of his undeveloped life. This is well worth our while. The boy is a problem to most of us mainly because we have not studied his character, his motives, his point of view, his life. Once in a while a pastor, a Sunday-school worker or some other person engaged in religious, educational or even reformatory work has unusual success in reaching and holding the boys, in winning their confidence and inspiring them with a desire to make something of themselves. Such a man is at once accounted a genius. We run off with the idea that this man is one in a thousand and that his influence with boys is a rare gift. Public opinion to the contrary nothwithstanding, I believe this man is doing only what most of us could do if we would.

The mainspring of our failure in reaching the boy is, I am thoroughly persuaded, not lack of ability, but lack of interest. I should say that the first requisite for success in boys' work must be interest. Not perfunctory interest, born of the very necessity of our relations to the boy, but real interest—vital interest. As chaplain of the naval training station I get many letters concerning our boys, but few of them show real interest—helpful interest—in the boys. These letters are written by persons who are inspired by a burdensome sense of duty and who feel that they must unload their responsibility on someone else. Reading between the lines, I can see that they are washing their hands of the whole business. They are concerned that someone else should teach their sons, their scholars, their parishoners. One letter recently received informed me that the writer was pastor of a large and influential church, and that he was deeply interested in the welfare of a boy who had recently come to the station; would I look him up and take a similar deep and helpful interest? The name of the boy was omitted, but perhaps the omission of a minor detail like this does not prove lack of interest.

The second thing to do for the boy is to get his point of view, learn to see things from his standpoint. The effect of this will be to divest our intercourse with the boy of much of its embarrassment for us and the boy. It will certainly help him to understand what we are trying to do for him—a consideration of prime importance. It will give to our effort a directness of aim that will commend it to the respect of the boy. Our work will not be a mere performance. The man who in his work for boys has an ambition to shine intellectually rarely does anything for their welfare, and mainly because he has failed to meet them on the level of thought and speech with which they are familiar. His stilted bookish speech is an impassable gulf. To To reach the comprehension of the boy simple, direct and earnest words are best; but in avoiding the stilted style one should not go to the other extreme, telling pointless "funny stories" or dropping into mere buffonery while laboring under the impression that he is "putting himself on the boy's level." Boys resent this attitude of painful condescension, as many a speaker has learned to his undoing.

And now the third thing we may do for the boy. Help him to a recognition of the importance of his present place in society. All too often the boy is simply tolerated. He is given to understand that he is allowed to exist for the present because later on he will be a man. His society is not cultivated, his boyish pranks are sternly rebuked, his awkwardness is ridiculed; by such means he is practically driven into the streets, and then we wonder why he seeks friends among the rude boys of the town. It is true that there is no very important work which the average boy can do, but it is altogether necessary to have him realize the relative importance of all that he does. If he once comes to regard his actions as unimportant and, therefore, valueless, a blow is struck at his self-respect from which he may never recover. The first step in the direction of a wild and reckless young manhood is all too often provoked by those who inspire a boy to put a low valuation upon his place in the social fabric. Many a man who occupies a weak and apologetic attitude toward society and whose life is nerveless and ineffecient can look back upon his boyhood and place his finger upon the very act which robbed his life of its ambition and even of its hope. The work a boy can do is not, in the nature of the case, a matter of great importance to the community, but it is, or should be, of great moment to the boy and the boy is of great importance to the community; therefore to see that he does his work well and to help him to have pleasure in it and to regard it as vital to his welfare is to render an important service to the boy and no less to society. His work may be, and in most cases should be, the ordinary work of the schoolroom, and to inspire him with a proper appreciation of the present and future value of this work should enlist the hearty co-operation of teacher and parent. I mention these truths, which should be axiomatic, because I believe they are persistently disregarded by many who are charged with the responsibilty of training boys.—Wiliam G. Cassard, Chaplain United States Naval Training Station.

RECIPES

Eat Little, but Have That Little Good

TURKEY FASHIONS.

Mary Foster Snyder, writing in Farm and Fireside, gives the following "new" way to prepare the turkey for Christmas dinner:

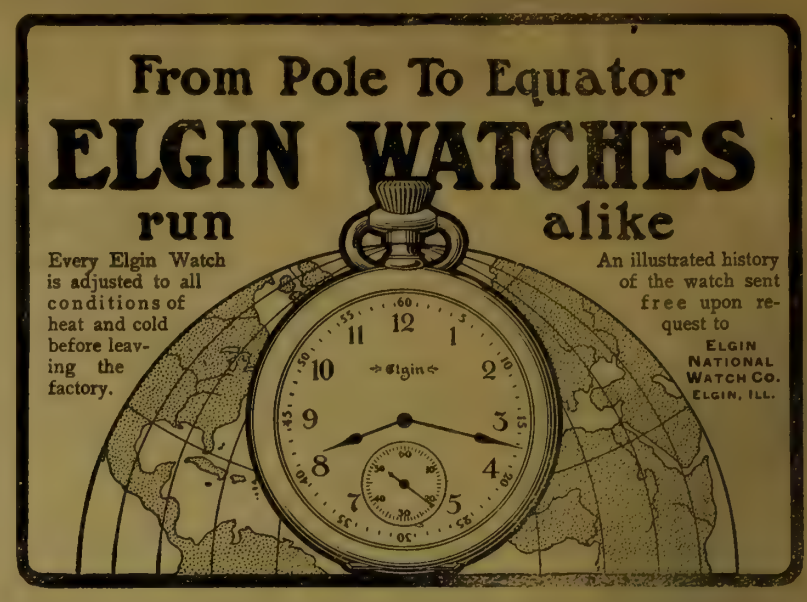
Turkey-Nests—Cook one tablespoonful of minced onion in two tablespoonfuls of butter for five minutes, then add two tablespoonfuls of flour and one cupful of gravy or stock. Simmer for a few minutes until quite thick and smooth, and season to taste. Strain, and add here two cupfuls of diced turkey. Set aside where it will keep hot for a few minutes, then turn out on a buttered platter. Make a few nest-like depressions in it, drop in each a few fine oysters, season to taste, sprinkle buttered crumbs over all, and place in a hot oven until the oysters begin to curl.

Scalloped Turkey—Fill a buttered baking-dish with alternate layers of chopped turkey, bread-crumbs and cream sauce, using one scant pint of sauce to each large cupful of turkey, and seasoning each layer to taste. Cover the top with buttered crumbs, and bake in a moderate oven until it is nicely browned.

Turkey Toast.—Chop cold turkey rather fine, and let it simmer for fifteen minutes in just enough stock or gravy to cover it; add a lump of butter, and salt, pepper and celery-salt to season. Have small slices of hot buttered toast, spread the turkey over it, and serve.

Deviled Turkey—Lay the wings and legs of a cold turkey on a broiler, and set over the fire until nicely browned. Make a sauce with one tablespoonful each of pepper-sauce, vinegar, French mustard and cranberry jelly, and season with salt, a dash of cayenne and some celery salt. Place the turkey on a heated dish, pour the sauce over it, and serve.

Fried Turkey.—Cut up a cold turkey into convenient pieces, dip each into beaten egg and bread-crumbs seasoned with salt, pepper and celery-salt, and fry in boiling oil or fat to a golden brown. Serve with mashed potato balls.



CHRISTMAS IN BETHLEHEM OF JUDEA.

Bethlehem, the home of Christmas, is that happy Utopia of which every American child dreams—it has more than one Christmas. In fact, it has three big ones, and strangely enough, the one falling on December 25th of our own calendar is not the greatest of the three. It is, at least, the first. Twelve days after the Latin has burned his Christmas incense in the sacred shine, says Woman's Home Companion, the Greek Church's patriarch, observing that it is Christmas time by his slow calendar, catches up the gloria, and bows in the Grotto of the Nativity for the devout in Greece, the Balkan States and all the Russias. After a period of another twelve days the great Armenian church of the East takes up the anthem of peace and good-will, and its patriarch visits the shrine.

All three of these big Christmas observances have some few things in common, at least one—the red fez-capped Mohammedan soldiery of the Sultan that stand with fixed bayonets as the background to brilliant pictures. In this most sacred of all Christian shrines, and especially on the natal day—according to the different calendars—of him who taught the brotherhood of man, the Latin, as he chants the song of good-will, must be protected from the fanatical Greek and Armenian; the Greek, as he sings his gloria, must be protected from fervid Armenian and Latin; and the Armenian, as he takes up the glad refrain, must be protected from Greek and Latin. All must be protected from Copt and other Christian churchmen, who, in their turn, must also be protected from the zealots of the three big churches. This duty falls on the followers of Mohammed. The presence of the armed Turkish soldiers has prevented riots at the Christmas and Easter festivals in recent years. The last great clash, thirty years ago, resulted from a discussion over some curtains. The result of that bloodshed in the holy of holies, and the constant threatening attitude of the different protectors of the holy shrines, was that the Sultan stationed a garrison of troops at Bethlehem, and connected the town with Jerusalem by a telegraph wire. Now, at every hour of the day and night, two Mohammedan soldiers with fixed bayonets stand sentry over the birthplace of the Nazarene.

FRESNO AGRICULTURAL WORKS

FRESNO, CALIFORNIA

Los Angeles Markets.

Los Angeles, Dec. 23, 1903.

As the Cultivator goes to press local creamery butter is on the upward tendency. Other brands have likewise advanced. It is hard to say what is the ruling price for eggs. Ranch are retailing as low as the wholesale price in some stores.

There is a good demand for chickens, better than for turkeys, though both sell well.

Rabbits are quickly taken at $1.50 to $2.00 per dozen.

Fish are plentiful, and so are lobsters.

Cranberries are going fast to the retail trade, wholesale business in them being less than last week.

Eastern	.25	@30

Poultry showed a firm demand this week owing to the approach of the holidays.

POULTRY—Old Roosters, per doz., $4.50@5.50; young Roosters, $5@6; Fryers, $4@4.50; Broilers, large, $4@4.50; small, $3@3.50; Hens, small, $4.50@5.50; large, $6@7; Ducks, per doz., old, $5.50@6.50; young, $6.50@7.50; Live Turkeys, per lb., 20@22c; Dressed Turkeys, per lb., 21@24c; Geese, per pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz, old, $1@1.25; Squabs, $2@2.25.

Fruits and Vegetables.

Since the beginning of the week general trading in Fruits has been of fair volume, and some good-sized transactions in top-quality offerings have been closed at full quotations. Wednesday's business in citrus fruits was moderately active in most lines, and the appearing prices were maintained with a marked degree of steadiness.

DECIDUOUS FRUITS.—Apples, per box, common, 40@65c; choice to fancy, 75@$1; extras, $1.25@1.50; Spitzenbergs, $1.75@2; Lady apples, $1.25@2.

Pears—Per box, Winter Nellis, $1.50@2.

Persimmons—Per box, 50c@$1.

Quinces—Per box, 40@50c.

Table Grapes—Per small box, 50@65c; crate, 90@$1; large box, $1@1.50.

BERRIES—Per chest: Strawberries, Longworth, $8@12; large varieties, $3@4, as to quality; raspberries, $5@7; cranberries, per bbl., Eastern, $12@13; Oregon, per box, $2.50@$3.50.

The market was fairly active this week, although prices ruled about as last week.

CITRUS FRUITS—Per box: Oranges, Navels, fancy, $1.75@2.50; choice, $1.25@1.75; Standard, 85c@$1.25; Seedlings, 75c@$1; Lemons, $1@2; Extra, $2.50; Grape Fruit, $1.75@3; Tangerines, $1@1.50; Japanese Mandarins, $1@1.50; Limes, $4@4.50.

Operators reported a decided improvement in the demand for Potatoes yesterday, but values, although firmer, were no higher, as current supplies were liberal and fully up to trade wants.

POTATOES—Per ctl: River Burbanks, 75c@85c; Early Rose, nominal; River Reds, 60@75c; Salinas Burbanks, $1.25@1.45; Oregon Burbanks, 85c@$1.05; Sweet Potatoes, $1.@1.15.

VEGETABLES—Tomatoes, per box, Bay, nominal; do, southern, per crate, $1@1.25; Green Peppers, per lb., 6@8c; Dried Peppers, Stockton, 5@8c; Southern, 11@12c; String Beans, per lb., 8@10c; Wax, 10@12½c; Green Peas, per lb., 4@6c; Egg Plant, per lb., 12½@15c; Summer Squash, per box, $1@1.25; Cucumbers, hothouse, per doz., $2.50; Mushrooms, per lb., 15@25c; Garlic, per lb., 6@7c; Dry Okra, per lb., 12½c; Marrowfat and Hubbard Squash, jobbing at ½@¾c per lb.

Dried Fruits, Nuts, Etc.

A European inquiry for Apricots, says the San Francisco Chronicle, which are very scarce, is the only interesting feature at present in the Dried Fruit market. Otherwise the trade is of tame appearance, with prices more or less nominal. The scant supplies of Apricots are making it difficult for the foreign buyers to close deals, although their bids are close in the neighborhood of present asking rates.

DRIED FRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 4½@6c; Sun Dried, 3¼@4c.

Apricots—Royal, fancy, 9@10c, choice, 7½c@8½c; Moorparks, choice, 9½@12c.

Peaches—Choice, 5¼@6c; fancy, 6¼@7c; peeled, in bxs, 11@14c.

Pears—Choice, 7½@8½c; fancy, 9c.

Plums—Pitted, 6¾9c; unpitted, 1@1½c

Prunes—Four sizes, 60s to 100s, 2¾@3c for Santa Clara; other sections, ¼@½c less

Nectarines—White, 4@5½c.

Beans.

DRIED PEAS—Prices, per ctl: Green, $2.50; Niles, $2.75.

The price for new crop is 19@22c per lb., according to quality.

The market for all Beans has doubtless settled down to a quiet state for the remainder of the year. The volume of business is very small, but the light supplies offering cause a

steady tone.

BEANS—Price per ctl: Large Whites, $2.40 @2.65; small do, $2.90@3.10; Pea, $3@3.10; Lima, $3.10@3.15; Red, $3@3.15; Pink, $2.60@ 2.75; Bayo, $2.25@2.45; Blackeyes, 2@2.15; Red Kidneys, $4.25@4.50.

Live Stock.

CATTLE—No 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 6¼@7c; No. 1 Cows and Heifers, 6½c, second quality, 5½@6c; thin Cows and Heifers, 4@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½c @4c, gross weight; Ewes, No. 1, 3¼@3¾c; gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb, live weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs and over, 5⅜@5½c; weighing under 130 lbs, 5@5¼c; weighing 260 to 350 lbs, 5@5¼c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

HAY—Prices on Hay, per ton: Wheat, $13.50@16.50; Wheat and Oat, $13@15.50; Oat, $11@15; Barley, 9.50@13; Clover, $10.50@11.50; Alfalfa, $9.50@11.50; Stock, $8.50@10.

FEED CORN MEAL—Choice grades, per ton, $28.50@$29.

MIDDLINGS—Per ton, $26.50@28.

BRAN—Per ton, $19.50.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

BRAN—Per ton, $21@22.

FEED CORN MEAL—Choice grades, per ton, $29.50@30.50.

BRAN—Per ton, $19.50@20.

COCOANUT CAKE—In lots of ten tons, $21; 5 tons, $21.50; less quantity, $22. Prices are mill rates and are subject to change without notice.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@ 4.85 per bbl; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—No. 1 shipping, per ctl., $1.35@ $1.37½; white milling, good to choice, $1.40@ $1.50.

BARLEY—Choice No. 1 feed, $1.11¼@$1.15; off grades, $107½@108¾; brewing, No. 1, $1.17½@$1.22¼; Chevalier, $1.30@1.45.

CRACKED CORN—Choice quality, per ton, $29@$30.

OATS—Good to choice white, $1.22@1.35.

Hops.

The price for new crop is 18@22c per lb., according to quality.

WOOL.

Fall clip, per lb: California Plains, 6@ 8c; Foothills, 8@10c; Middle Country, 10c@ 12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

Chicago, December 23.

Interest lags in the wheat pit, as trade assumes the dullness of the holidays Cash quotations yesterday were as follows: Flour was dull and easy; No. 2 spring wheat, 78@83; No. 3, 80; No. 2 red, 82½@86; No. 2 corn, 41¾; No. 2 yellow, 43½; No. 2 oats, 37; No. 3 white, 34¾@37¾; No. 2 rye, 52½; good feeding barley 35@36½; fair to choice malting, 43@52; No. 1 flax seed, 93; prime timothy seed, 2.90; mess pork, per bbl., 11.75@11.87½; lard, per 100 lbs., 6.45@6.50; short ribs, sides (loose), 6.00@ 6.25; clover, contract grade, 11.25.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	25,800	6,900
Wheat, bushels	72,200	18,400
Corn, "	47,200	72,500
Oats "	177,600	101,600
Rye, "	1,900	11,600
Barley "	70,300	16,900

Chicago Live Stock.

CHICAGO, Dec. 23.—Cattle—Receipts, 4000, steady; good to prime steers, 4.90@5.75; poor to medium, 3.25@4.80; stockers and feeders, 2.00@4.00; cows, 1.50@3.50; heifers, 2.00@4.75; canners, 1.50@2.20; bulls, 1.75@4.25; calves, 2.00@5.75. Hogs—Receipts, today, 25,000; tomorrow, 35,000; strong; mixed and butchers, 4.35@4.60; good to choice heavy, 4.45@4.55; rough heavy, 4.30@4.45; light, 4.15@4.20; bulk of sales, 4.35@4.50. Sheep—Receipts, 14,000; sheep and lambs steady; good to choice wethers, 3.50@4.00; fair to choice mixed, 2.75@ 3.50; western sheep, 2.75@4.00; native lambs, 4.00@5.85; western lambs, 3.75@5.40.

California Dried Fruits.

NEW YORK, Dec. 23.—The market for evaporated apples is firm, with demand good; common are quoted at 4@5; prime, 5¾@6½; choice, 6@6½, and fancy, 7. Prunes are firm at 3⅝@6½, according to grade. Apricots quiet; choice, 9½; extra choice, 9¾@10¼; fancy, 11@15. Peaches steady; choice, 7¼@7¾; extra choice, 7¾@8¼; fancy, 9¼@10¼.

CITRUS MARKETS

THE ORANGE MARKET.

The market has been quite active during the past week, jobbers supplying themselves with Christmas stock, for which the supplies in sight seem ample, and there is an overstock of large sizes of which but few can be used at the smaller western points. Quite a number of cars will be left over. Southern stock is quite closely cleaned up, and there is some demand for shipment from this section.

Auction markets have sold at low averages; nearly all, however, being 126s and larger in Navels. Some Seedlings have been selling fairly well at these points, while it is very difficult to dispose of any of these in the west.

THE LEMON MARKET.

The Lemon market shows no improvement from its demoralized condition, and the prospects are not favorable for any change for the better. Lighter shipments are going out, however, which may make the average results on what is shipped more satisfactory. Off size and standard stock will not bring over cost of packing and shipping.

AUCTIONS.

NEW YORK, DEC. 17.

C. C. U. Porterville Mariposa navels $2.05, Mistletoe navels $1.75.

C. C. U. Lindsay Hollywreath navels $1.95.

PHILADELPHIA, DEC. 17.

C. C. U. Lindsay Holly navels $2.20.

T. C. Zante Forgetmenot navels $2.00.

NEW ORLEANS, DEC. 17.

T. C. Porterville Oakleaf seedlings $1.80, fruit partly green.

CLEVELAND, DEC. 17.

C. C. U. Lindsay Holly navels $3.10.

NEW YORK, DEC. 18.

S. S. Orange, S. S. navels $2.75.

T. C. Exeter, Affection navels $2.00.

SOUTHERN PACIFIC
CHOICE OF 3 ROUTES
EAST AND WEST
"SUNSET" Via El Paso and New Orleans
"OGDEN"
Via San Francisco and Portland "SHASTA"

The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.

SOUTHERN PACIFIC
261 SOUTH SPRING ST.

Coulson's Food for Calve...

A special compound of food stuffs to be mixed with the milk, for

PREVENTING THE SCOURS

and an aid in fattening for the market. Promotes the growth of calves, as it is a great flesh producer. It prevents the scours and keeps Calves in good, healthy condition.

Directions for Feeding Calves.

Commence with small amount first, say about a handful, put in a pail—pour over it a little hot water to scald it (use scalding hot water to pour over it so as to kind of cook the starches in the food) then pour in the milk or skim milk. As the calf grows older you can feed more of this food, and instead of using a handful use a pint or a quart of the food with skim milk.

Coulson's Food for Calves is not only a developer, muscle and bone builder, but it is also an appetizer.

By the addition of Coulson's Food for Calves to the skim milk or milk, it is made more palatable and the calves will eat it readily and greedily.

Keep your calves in A1 growing condition by using Coulson's Food for Calves. It regulates the bowels and stomach and keeps the digestive organs in good shape so that they can do the work properly and the calves will grow and put on flesh rapidly.

Price 90-lb. Sack, $2.50; 50 pounds, $1.50; a small amount, 4 cents a pound.

Its cost is small, as it only takes a little of it for a feed. Prepared by

A. R. Coulson Co., Inc.,
Factory: First and E St. and 772-774 Main St., Petaluma, Cal.

THE FEEDING PROBLEM

STUFFING AND STARVING

SCHOONERS BRINGING FEED TO PETALUMA, WHERE COULSON'S EGG FOOD IS MADE.

When hens do not lay at all or do not lay well, many owners think that if the hens look well, are rosy, plump and fat, it is an indication that the hens surely receive ample supplies of food. But in this they are mistaken, although they may stuff their hens with soft feed, wheat and corn and the hens may be fat and heavy as lead and yet they are actually starving for lack of protein and minerals, etc., that they need more of than they can get.

They are expected to lay eggs when they are not fed the material that makes eggs. When hens are fed on wheat, corn, middlings, etc., food that contains one part protein or muscle-forming food and nine parts of carbohydrates and fat, they will gradually get too fat to lay because all the protein they receive in the food is needed for their body sustainance and there is nothing left for eggs, except excesses of other nutriments which she cannot use for body maintenance, will not alone make eggs and can only be stored as layers of fat where they are less than useless. Instances are common where fowls receive more than sufficient food but it is so badly balanced that they lay few or no eggs.

Feeding is not everything in poultry keeping, but it is one of the most important ways of getting results.

Proper feeding of Coulson's Egg food, besides making hens lay will also help to produce Plumage that will make the fowl indifferent to cold or rain. Coulson's Egg Food is designed to give the laying fowls just what they are kept for—eggs.

This Food contains in adequate quantity eevrything that is necessary to make perfect eggs which will permit of perfect development of chicks while in the egg. Therefore, if you want eggs that will be hatchable and hatch good strong chicks, you should feed Coulson's Egg Food, a complete balanced ration for laying hens.

The egg is the surplus which the hen throws off after all the needs of her system have been supplied, the excess over and above what she needs to repair waste and keep her in perfect health.

Unless a hen is supplied with material for egg production she cannot lay. She can no more produce egg without the proper food than a factory can turn out a finished product without raw material.

FEEDING FOR EGGS

A hen generally consumes from six to eight ounces of feed a day. If she is fed on shorts, or common chop feed, she will have to eat from one to three lbs. before she gets enough material to produce an egg, besides supplying her bodily needs, and as it will take from three to five days for a hen to consume that much food, she will be able to lay only one egg every four days' time.

Now, if this same hen should be fed on a rich egg producing food, like Coulson's Egg Food, she would have to eat only eight ounces to give her enough material to form the egg and supply her bodily needs, besides; so it can readily be seen that if a hen be fed on Coulson's Egg Food two meals a day she will be able to lay an egg nearly every day.

The men who get results in egg production are the men who pay great attention to feeding, and feeding egg producing food—Coulson's Egg Food.

It is a wholesome and safe food, contains nothing injurious. A correctly balanced ration; a scientific poultry food, prepared by people who know how. It is not an experiment. It is successfully used by hundreds of the most successful poultrymen and recommended highly. Fed as a warm mash either morning, noon or evening. Saves bother in mixing; your time is your money. Produces excellent results by natural methods. Price reasonable—cheapest feed on the market, for it gives best results. Goes twice as far as ordinary feed; increases egg production, furnishes bone, muscle, feathers and meat and helps fowls to grow. Pullets begin laying earlier. Shortens moulting period. You can have eggs in winter when eggs are profitable. It is just the feed that all poultrymen are looking for—a feed that makes hens lay nearly every day.

One hundred and seventy-five eggs per year per hen by feeding Coulson's Balanced Egg Food.

Are you feeding your hens this feed? If you are not, you are making a great mistake. Coulsons prepared food for laying hens is just what your hens need and they must have it if you expect them to lay many eggs at this time of year. There is in this egg food everything necessary to help the hen grow the eggs.

D. H. Ward of Cotati, says: "I have fed Coulson's Egg Food for over a year and I am well satisfied with it. I am now getting 90 dozen eggs a week from 500 hens. My hens laid well last winter on this food and I shall continue to feed it this winter."

Others try to economize by feeding a cheaper feed but they make a great mistake.

Price of Coulson's Egg Food at the Factory, we do not pay freight: One sack, $1.65; 5 sacks, $7.75; ½ ton, 11 sacks, $16.50; 1 ton, 22 sacks, $33.00. We place on cars free of charge.
